Disclosures

For the past 12 months:

- **Consulting/Advising**: AbbVie, BMS, Genentech, Gilead, GlycoMimetics, Pfizer, Servier
- **Grant/Research support to my institution**: 47, AbbVie, Amgen, AROG, Celgene, Daiichi Sankyo, F. Hoffmann-La Roche, Forma, Genentech/Roche, Gilead, GlycoMimetics, Hanmi, Immune-Onc, Incyte, Jazz, Loxo, Pfizer, Pharmacyclics, Sigma Tau, Treadwell

2

Learning Objectives

- Using a case-based approach:
  - Review standard and emerging treatment options for AML
  - Discuss current approaches to treating MDS

3

Case 1

A 65-year-old woman is diagnosed with AML after presenting with SOB and bruising. CBC showed WBC 25, Hgb 6, Plt 20, and 60% circulating blasts. BMBx showed 65% myeloblasts, trisomy 8 and mutations in RUNX1 and ASXL1. She is fit for induction chemotherapy.

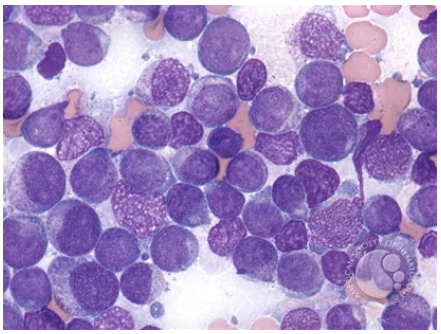
What is this patient's ELN 2017 risk?

How should we treat this patient?

4

Acute Myeloid Leukemia

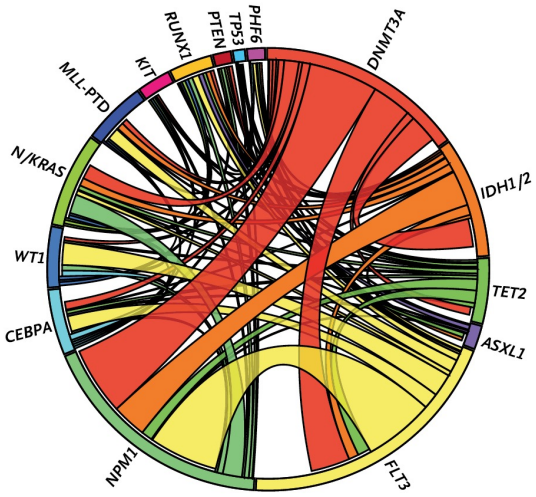
- Clonal expansion of immature myeloid cells
- Heterogeneous disease
- 20,050 new cases (M>F) with 11,540 deaths expected in US in 2022
- Median age 68
- Bleeding, infections, anemia
- High relapse rates



ACS Cancer Statistics, 2022.
ASH Image Bank.

5

Recurrent Mutations in AML



Gene	Overall Frequency (%)
FLT3 (ITD, TKD)	37 (30, 7)
NPM1	29
DNMT3A	23

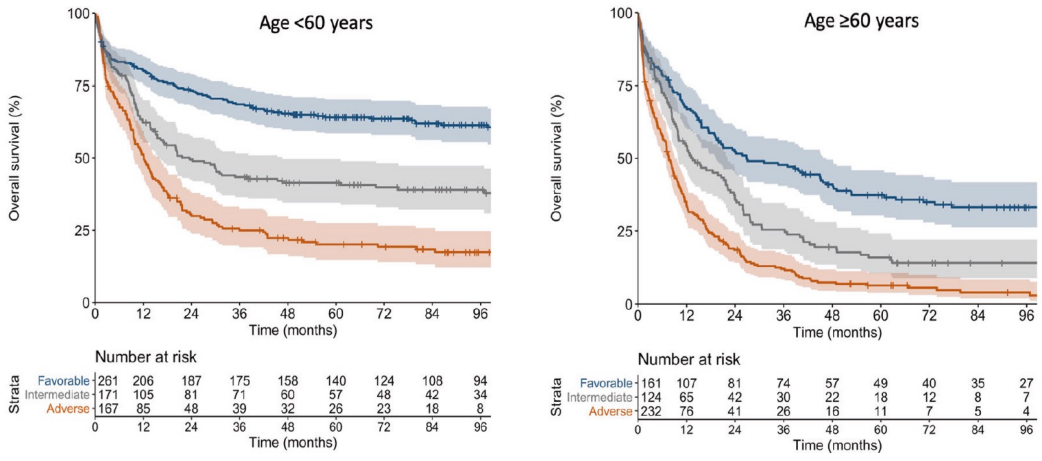
7

ELN 2017 Risk Stratification - Validation



Herold et al, Leukemia 2020

8

ELN 2022 Risk Stratification

Risk Category[b]	Genetic Abnormality
Favorable	• t(8;21)(q22;q22.1)/*RUNX1::RUNX1T1*[b,c] • inv(16)(p13.1q22) or t(16;16)(p13.1;q22)/*CBFB::MYH11*[b,c] • * Mutated *NPM1*[b,d] without *FLT3*-ITD • * bZIP in-frame mutated *CEBPA*[e]
Intermediate	• * Mutated *NPM1*[b,d] with *FLT3*-ITD • * Wild-type *NPM1* with *FLT3*-ITD • t(9;11)(p21.3;q23.3)/*MLLT3::KMT2A*[b,f] • Cytogenetic and/or molecular abnormalities not classified as favorable or adverse
Adverse	• t(6;9)(p23;q34.1)/*DEK::NUP214* • t(v;11q23.3)/*KMT2A*-rearranged[g] • t(9;22)(q34.1;q11.2)/*BCR::ABL1* • * t(8;16)(p11;p13)/*KAT6A::CREBBP* • inv(3)(q21.3q26.2) or t(3;3)(q21.3;q26.2)/*GATA2, MECOM(EVI1)* • * t(3q26.2;v)/*MECOM*(*EVI1*)-rearranged • -5 or del(5q); -7; -17/abn(17p) • Complex karyotype,[h] monosomal karyotype[i] • * Mutated *ASXL1, BCOR, EZH2, RUNX1, SF3B1, SRSF2, STAG2, U2AF1, or ZRSR2*[j] • Mutated *TP53*[k]

[a] Frequencies, response rates and outcome measures should be reported by risk category, and, if sufficient numbers are available, by specific genetic lesions indicated.
[b] Mainly based on results observed in intensively treated patients. Initial risk assignment may change during the treatment course based on the results from analyses of measurable residual disease.
[c] Concurrent of *KIT* and/or *FLT3* gene mutation does not alter risk categorization.
[d] AML with *NPM1* mutation and adverse-risk cytogenetic abnormalities are categorized as adverse-risk.
[e] Only in-frame mutations affecting the basic leucine zipper (bZIP) region of *CEBPA*, irrespective whether they occur as monoallelic or biallelic mutations, have been associated with favorable outcome.
[f] The presence of t(9;11)(p21.3;q23.3) takes precedence over rare, concurrent adverse-risk gene mutations.
[g] Excluding *KMT2A* partial tandem duplication (PTD).
[h] Complex karyotype: ≥3 unrelated chromosome abnormalities in the absence of other class-defining recurring genetic abnormalities; excludes hyperdiploid karyotypes with three or more trisomies (or polysomies) without structural abnormalities.
[i] Monosomal karyotype: presence of two or more distinct monosomies (excluding loss of X or Y), or one single autosomal monosomy in combination with at least one structural chromosome abnormality (excluding core-binding factor AML).
[j] For the time being, these markers should not be used as an adverse prognostic marker if they co-occur with favorable-risk AML subtypes.
[k] *TP53* mutation at a variant allele fraction of at least 10%, irrespective of the *TP53* allelic status (mono- or biallelic mutation); *TP53* mutations are significantly associated with AML with complex and monosomal karyotype.

* Changes from ELN 2017

Dohner et al, Blood 2022

9

Determining "Fitness" for AML Patients

- Disease-related prognostic factors
  - Adverse risk mutations
  - Multidrug-resistance
  - Antecedent hematologic disorders
- Patient-related prognostic factors
  - Comorbidities
  - Psychosocial factors

Ossenkoppele and Lowenberg, Blood 2015.

10

Ferrara Criteria to Define Unfitness for Intense Chemotherapy for AML

Table 3. Operation criteria to define unfitness to intensive chemotherapy in AML

1. An age older than 75 years
2. Congestive heart failure or documented cardiomyopathy with an EF $\leq$50%
3. Documented pulmonary disease with DLCO $\leq$65% or FEV1 $\leq$65%, or dyspnea at rest or requiring oxygen, or any pleural neoplasm or uncontrolled lung neoplasm
4. On dialysis and age older than 60 years or uncontrolled renal carcinoma
5. Liver cirrhosis Child B or C, or documented liver disease with marked elevation of transaminases (>3 times normal values) and an age older than 60 years, or any biliary tree carcinoma or uncontrolled liver carcinoma or acute viral hepatitis
6. Active infection resistant to anti-infective therapy
7. Current mental illness requiring psychiatric hospitalization, institutionalization or intensive outpatient management, or current cognitive status that produces dependence (as confirmed by the specialist) not controlled by the caregiver
8. ECOG performance status $\geq$3 not related to leukemia
9. Any other comorbidity that the physician judges to be incompatible with conventional intensive chemotherapy

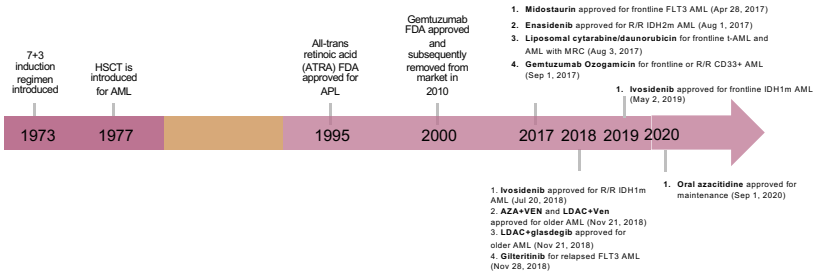
Abbreviations: AML, acute myeloid leukemia; DLCO, diffusing capacity of the lungs for carbon monoxide; ECOG, Eastern Cooperative Oncology Group; EF, ejection fraction; FEV1, forced expiratory volume in 1 s.

Ferrara et al, Leukemia 2013.

11

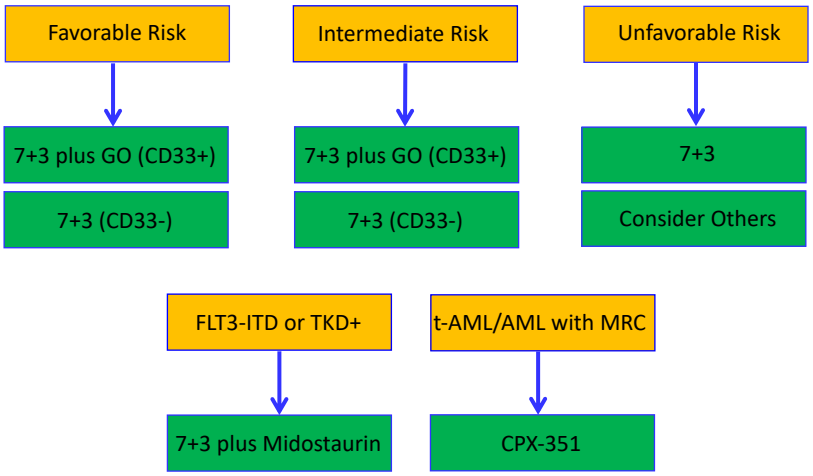
Recent FDA Approvals for AML

Since its introduction in the early 1970s, 7+3 therapy (Cytarabine for 7 days + Anthracycline for 3 days) has been the standard of care for AML



12

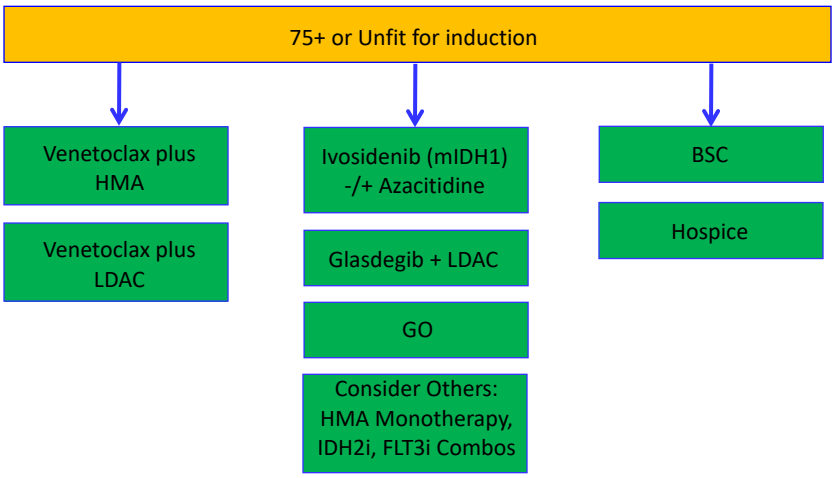
First-Line Treatment of Fit AML in 2022



Based on NCCN guidelines, AML v1.2022

13

First-Line Treatment of Older/UnFit AML in 2022



Based on NCCN guidelines, AML v1.2022

14

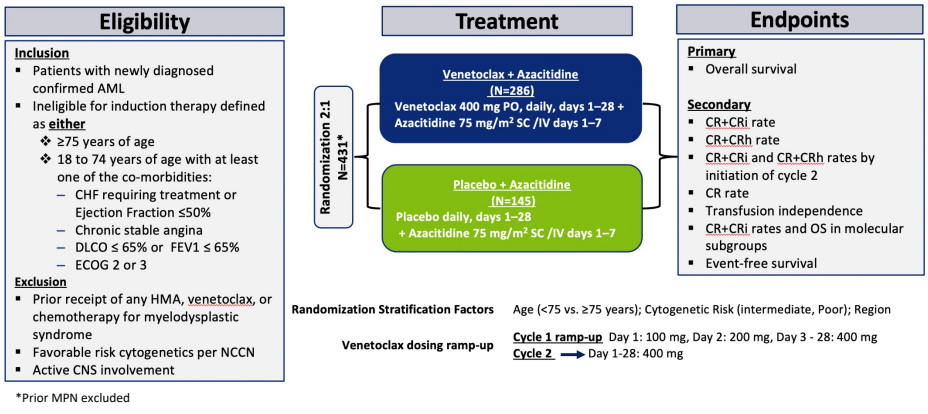
Case 2

A 76-year-old man is diagnosed with AML after presenting with fatigue and dyspnea. CBC showed WBC 15, Hgb 6, Plt 75, and 60% blasts. BMBx showed 90% blasts, normal cytogenetics and mutations in NPM1 and IDH2 R140Q.

How should we treat this patient?

15

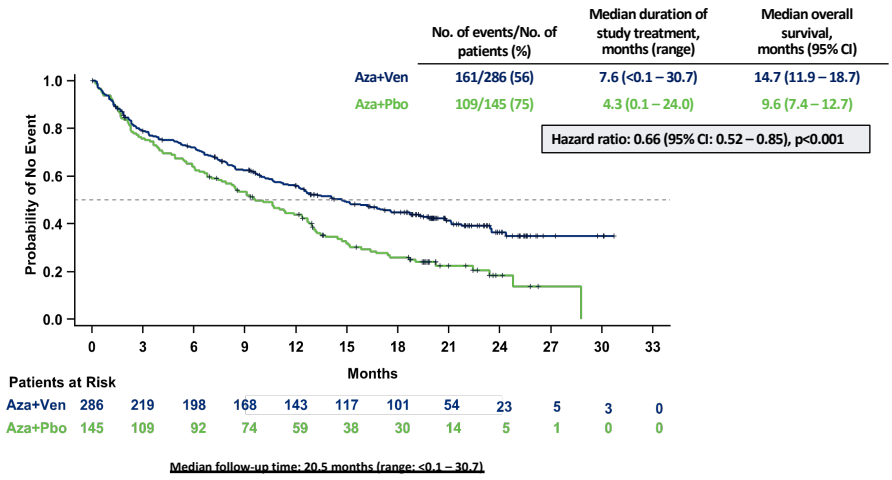
VIALE-A: Azacitidine plus Venetoclax vs Aza-PBO



DiNardo et al, NEJM 2020.

16

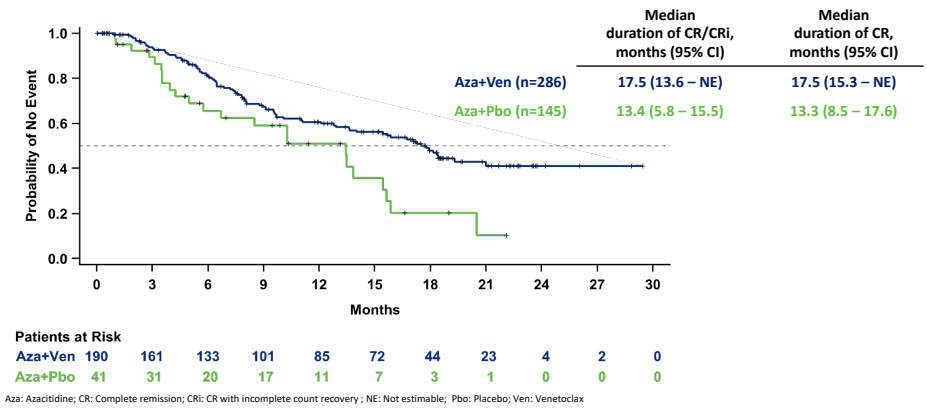
Aza-Ven vs Aza-PBO: OS



DiNardo et al, NEJM 2020.

17

Aza-Ven vs Aza-PBO: DoR after CR/CRi



Aza: Azacitidine; CR: Complete remission; CRi: CR with incomplete count recovery ; NE: Not estimable; Pbo: Placebo; Ven: Venetoclax

DiNardo et al, NEJM 2020.

18

Aza-Ven vs Aza-PBO: Responses

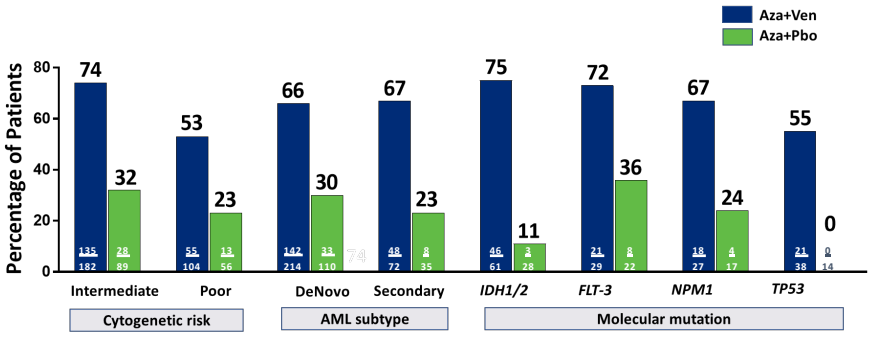
	No. of treatment cycles, median (range)	Median time to CR/CRi, Months (range)	*CR+CRi by initiation of Cycle 2, n (%)
Aza+Ven (n=286)	7.0 (1.0 – 30.0)	1.3 (0.6 – 9.9)	124 (43.4)
Aza+Pbo (n=145)	4.5 (1.0 –26.0)	2.8 (0.8 – 13.2)	11 (7.6)

*CR+CRi rate, CR rate, and CR+CRi by initiation of cycle 2 are statistically significant with p<0.001 by CMH test

DiNardo et al, NEJM 2020.

19

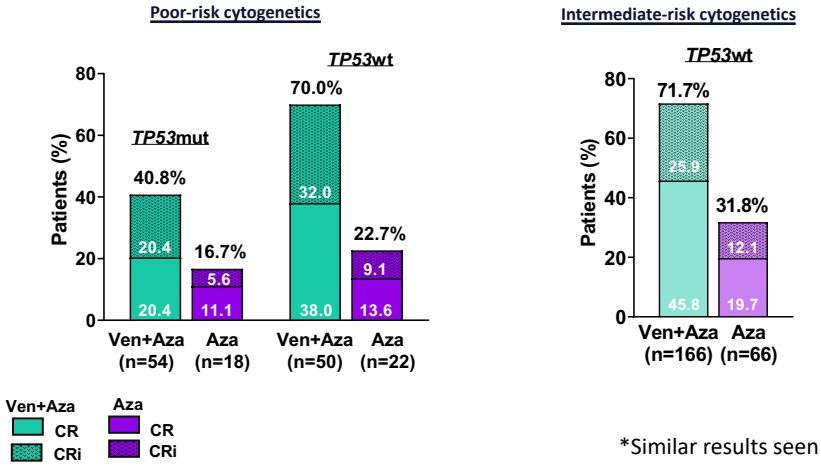
Aza-Ven vs Aza-PBO: Responses by Subgroup



DiNardo et al, NEJM 2020.

20

Aza-Ven vs Aza-PBO: Responses in Poor-risk Cytogenetics -/+ TP53 Mutation



*Similar results seen for DoR and OS

Aza, azacitidine; CI, confidence interval; CR, complete remission; CRi, CR+ incomplete hematological remission; mut, mutation; Ven, venetoclax; wt, wild-type

Pollyea et al, ASH 2021 Abstract #224.

21

Case 2, Continued

Our 76yo M with newly diagnosed AML with NPM1 and IDH2 R140Q mutations is admitted and started on azacitidine and venetoclax with TLS prophylaxis and dose ramp up. He completes cycle 1. End of cycle 1 bone marrow biopsy shows MLFS.

What should we do now? Start cycle 2 now? Delay the start of cycle 2 for count recovery? Use G-CSF?

How should we dose cycle 2? Future cycles?

Should we be using antifungal prophylaxis?

≤60 days after first dose of study drug	43 (15)	24 (17)
Other, n (%)		
Tumor lysis syndrome††	3 (1)	0

*Dose interruptions commonly due to neutropenia (19%/10%), febrile neutropenia (20%/4%), and thrombocytopenia (10%/4%); interruptions include delays between cycles and reduced duration from 28 to 21 days per cycle for count recovery after marrow leukemia clearance; †Dose reduction for AEs or other medications; †† 3 cases of TLS during ramp up.

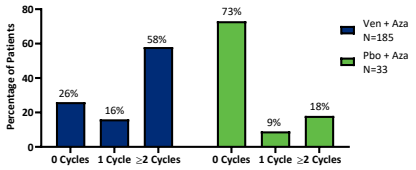
DiNardo, Jonas, Pullarkat et al, EHA 2020 Abstract# LB2601.
DiNardo, Jonas, Pullarkat et al, NEJM 2020.

25

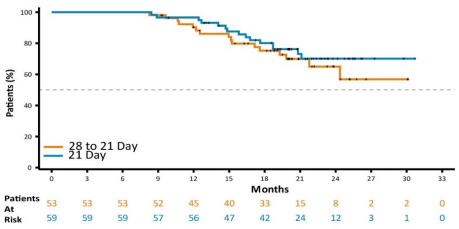
Cytopenia Management on the VIALE-A Trial

Patients with best response of CR or CRh with a post-remission Grade 4 cytopenia lasting ≥7 days, n (%)	Ven + Aza (n=185)	Pbo + Aza (n=33)
0 events	24 (13)	18 (55)
1 event	36 (19)	8 (24)
≥2 events	125 (68)	7 (21)

Number of Patients Who Achieved CR/CRh Who Had Post-remission Cycles With a Reduction in Dosing Duration and/or Cycle Delay ≥7 Days Related to Cytopenia



Overall Survival Among Patients Who Acheived CR/CRh in VIALE-A (Converted to 21-Day Dosing After 1st Grade 4 Cytopenia)



Pratz et al, ASH 2020, Abstract 1944.

26

Timing of Response to HMA-Ven

Figure 1A. Time to First Response of CR/CRi in M14-358

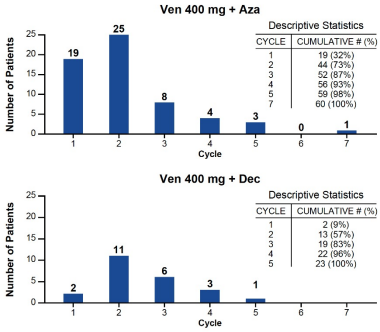


Figure 2. Overall Survival by Timing of Response

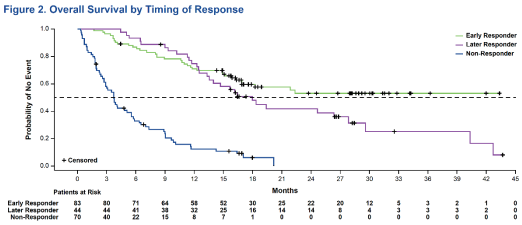


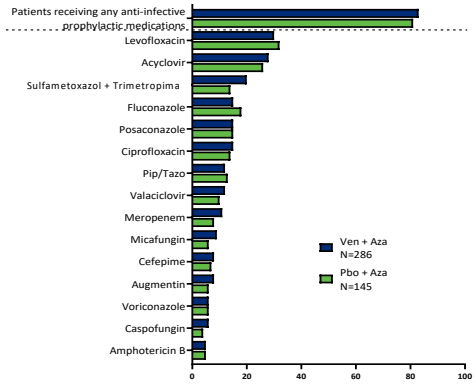
Jonas et al, ASCO 2020.

27

Use of CYP3A4i on the VIALE-A Trial

- Anti-infective prophylaxis was required for patients with absolute neutrophil count <500/µL
- Common anti-infective CYP3Ai include moderate inhibitors such as fluconazole, isavuconazole, ciprofloxacin, and strong inhibitors such as itraconazole, posaconazole, and voriconazole

Prophylactic Anti-infective Use in VIALE-A*



*Medications listed were used in ≥ 5% of patients receiving anti-infective prophylaxis (list not exclusive to CYP3A inhibitors).

Jonas et al, ASH 2020, Abstract 2846.

28

Use of CYP3A4i on the VIALE-A Trial

	Ven + Aza			Pbo + Aza		
Outcome†	None (n=153)	Moderate (n=25)	Strong (n=14)	None (n=32)	Moderate (n=3)	Strong (n=6)
Median time to CR+CRi, mo (range)	1.2 (0.6–9.9)	1.4 (1.0–5.5)	1.4 (0.9–5.4)	2.8 (0.8–13.2)	2.8 (1.1–6.3)	2.8 (1.0–5.3)

Overall Survival in Ven + Aza

	Survival Estimate (%) (95% CI)			Median (Months) (95% CI)
Events	Month 6	Month 12	Month 24	
126	71.7 (65.3, 77.1)	55.8 (49.0, 62.1)	37.9 (30.2, 45.6)	15.2 (11.2, 20.8)
27	73.2 (56.8, 84.1)	53.0 (36.6, 66.9)	29.4 (15.1, 45.3)	12.3 (7.6, 19.3)
14	67.9 (44.1, 83.2)	58.2 (34.9, 75.7)	26.2 (8.1, 48.9)	12.2 (3.9, 21.1)

- There was not a major impact on response rate, time to response, OS, frequency of infections or treatment discontinuation with moderate or strong CYP3Ai compared to no CYP3Ai

Jonas et al, ASH 2020, Abstract 2846.

29

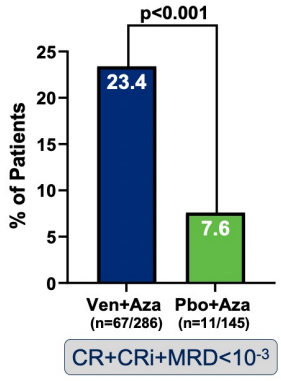
Case 2, Continued

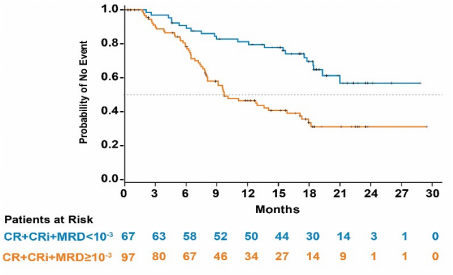
Our 76yo M with newly diagnosed AML with NPM1 and IDH2 R140Q mutations is is treated with venetoclax and decitabine and achieves a MRD positive CR after cycle 1. He continues on treatment and his end of cycle 4 bone marrow biopsy shows an MRD negative CR.

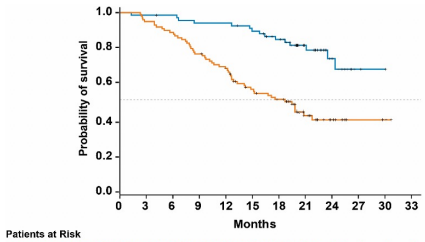
He asks about the impact of her MRD status as well as if there is a role for transplant in her care.

30

VIALE-A Trial: MRD Response, DoR and OS







Duration of remission	# of events	12-month, % (95% CI)	18-month % (95% CI)	Median DoR, months (95% CI)
CR+CRi+MRD<10-3	22	81.2 (69.3, 88.9)	69.6 (55.9, 79.8)	NR (19.3 – NR)
CR+CRi+MRD≥10-3	54	46.6 (35.6, 56.8)	33.5 (22.9, 44.5)	9.7 (8.0 – 15.8)

Overall survival	# of events	12-month, % (95% CI)	18-month % (95% CI)	Median OS, months (95% CI)
CR+CRi+MRD<10-3	15	94.0 (84.7, 97.7)	84.6 (73.3, 91.4)	NR (24.4 – NR)

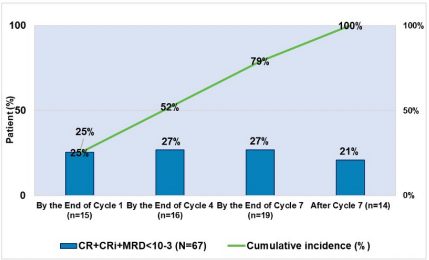
Pratz et al, ASCO 2021, Abstract 7018.
Pratz et al, EHA 2021, Abstract S137.

31

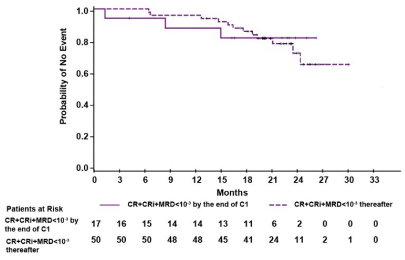
VIALE-A Trial: Timing of MRD Response and OS

MRD by treatment cycles



Note: End of cycle (C) 1: MRD<10-3 from C1 Day (D) 1 to end day of C1+7 days
End of C4: MRD<10-3 from end day of C1+8D to min (End day of C4, last dose +7 days)
End of C7: MRD<10-3 from end day of C4+1D to min (end day of C7, last dose +7 days
After C 7: End day of C7+1D and onward up to cutoff date: Jan 04, 2020.

OS by treatment cycles



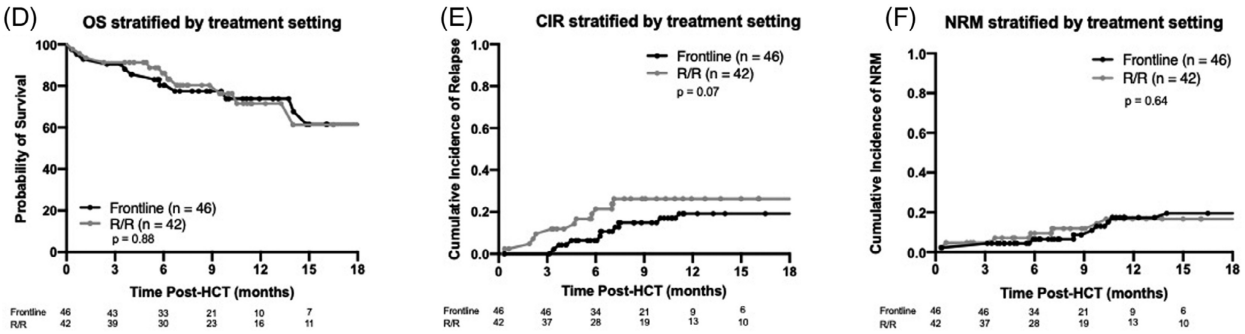
Overall survival	# of events	12-month, % (95% CI)	18-month % (95% CI)	Median OS, months (95% CI)
CR+CRi+MRD<10-3 by end of cycle 1	3	87.8 (59.5, 96.8)	81.6 (53.0, 93.7)	NR (NR – NR)
CR+CRi+MRD<10-3 thereafter	12	96.0 (84.9, 99.0)	85.8 (72.5, 93.0)	NR (24.4 – NR)

NR: Not reached; OS: Overall survival

Pratz et al, ASCO 2021, Abstract 7018.
Pratz et al, EHA 2021, Abstract S137.

32

Allo-HCT is Feasible after HMA plus Venetoclax in Frontline and r/r AML



Pooled retrospective data from UC Davis, UCSF, UCLA, UCSD, and Stanford

Kennedy et al, AJH 2022.

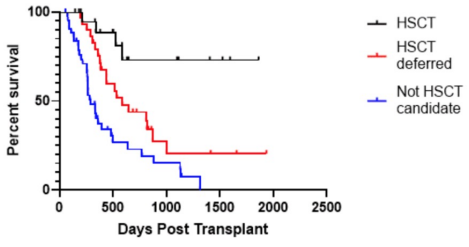
33

Outcomes of AML Patients Treated with Aza/Ven Are Improved After HSCT Compared to Maintenance Aza/Ven

Table 1: Disease status characteristics

ELN risk	SCT patients	SCT deferred patients
High	15	16
Intermediate	3	4
Favorable	3	10
Disease status at SCT consult		
CR/CRi without MRD	2	11
CR/CRi with MRD	11	11
MLFS/Aplasia/persistent disease	6	6
Disease status at time of SCT		
CR/CRi without MRD	7	
CR/CRi with MRD	10	
MLFS/Aplasia	4	
Best response in non-SCT patients		
CR/CRi without MRD		21
CR/CRi with MRD		8
MLFS/Aplasia		1

Figure 1: Overall survival



Pollyea et al, ASH 2020, Abstract 78.

34

Case 3

- An 80-year-old woman is diagnosed with AML after presenting with fevers and progressive shortness of breath. CBC showed WBC 1, Hgb 7.4, Plt 60, and 20% blasts. BMBx showed 40% blasts and normal cytogenetics and mutations in IDH1 R132C and ASXL1. CXR is clear.

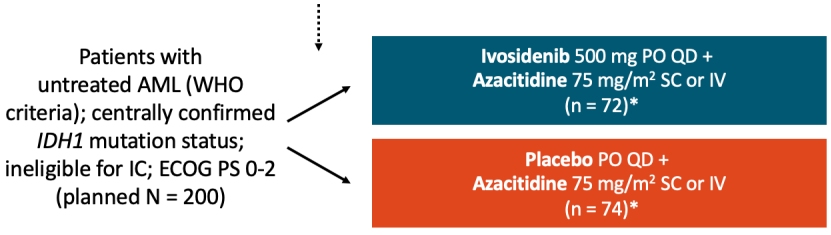
What should we offer as first line treatment for this patient?

35

AGILE: Ivosidenib+Azacitidine vs PBO+Aza for Newly Diagnosed AML with mIDH1

- Multicenter, double-blind, randomized phase III trial

Stratified by region (US/Canada vs Western Europe, Israel, and Australia vs Japan vs rest of world) and disease history (de novo vs secondary AML)



*Enrollment at time of data cutoff (May 18, 2021).

- Enrollment halted based on efficacy as of May 12, 2021 (N = 148)
- **Primary endpoint:** EFS with ~173 events (52 mo)
- **Secondary endpoints:** CRR, OS, CR + CRh rate, ORR

39

Case 4

A 68-year-old man was diagnosed with AML after presenting with fatigue and SOB. BMBx showed 70% CD33 negative myeloblasts and trisomy 8 and BCOR mutation. He is medically fit for induction and transplant.

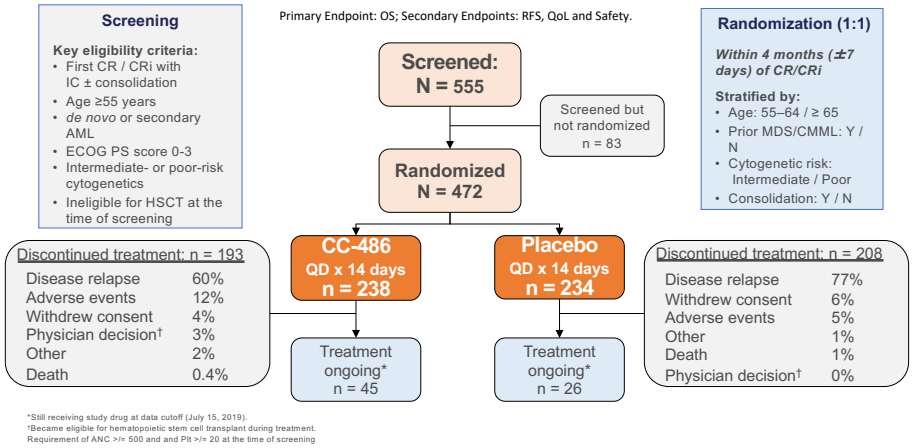
He is induced with 7+3 and achieves an MRD negative CR. He has one cycle of intermediate dose cytarabine for consolidation but tolerates it poorly and it is determined not to pursue additional chemotherapy. He is now unfit for transplant and he currently has no identified donor. He has an end of treatment BMBx that confirms MRD negative CR.

What is the next step: Surveillance or maintenance?

40

QUAZAR AML-001 Maintenance Trial
CC-486 (Oral Azacitidine)

Patient DISPOSITION / SCHEMA



Wei et al, ASH 2019. Abstr LBA 3.
Wei et al, NEJM 2020.

41

QUAZAR Trial – Patient Characteristics

Table 1. Baseline Demographic and Disease Characteristics.*

Characteristic	CC-486 (N=238)	Placebo (N=234)	Total (N=472)
Response after induction therapy — no. (%)			
Complete remission	187 (79)	197 (84)	384 (81)
Complete remission with incomplete blood count recovery	51 (21)	37 (16)	88 (19)
Receipt of consolidation therapy — no. (%)			
Yes	186 (78)	192 (82)	378 (80)
No	52 (22)	42 (18)	94 (20)
Median time from induction therapy to randomization (range) — mo	4.0 (1.4–8.8)	4.0 (1.3–15.1)	4.0 (1.3–15.1)
Median time from complete remission to randomization (range) — days‡	84.5 (7–154)	86.0 (7–263)	85.0 (7–263)
Median bone marrow blasts (range) — %§	2.0 (0.0–5.0)	2.0 (0.0–6.5)	2.0 (0.0–6.5)
Positive for measurable residual disease — no. (%)¶	103 (43)	116 (50)	219 (46)
Median platelet count (range) — $\times 10^{-9}$/liter§	154 (22–801)	179 (16–636)	165 (16–801)
Median absolute neutrophil count (range) — $\times 10^{-9}$/liter§	3.0 (0.3–15.9)	2.8 (0.5–9.6)	2.9 (0.3–15.9)

Wei et al, NEJM 2020.

42

QUAZAR Trial – Safety

- Median treatment durations:
  - CC-486: 12 cycles (range 1–80)
  - Placebo: 6 cycles (range 1–73)
- CC-486 safety profile was generally consistent with that of injectable AZA[1]
- Gastrointestinal adverse events (AEs) in the CC-486 arm were most common during the first 2 treatment cycles
- Serious AEs were reported for 34% and 25% of patients in the CC-486 and placebo arms, respectively
- No treatment-related deaths

1. Dombret et al. *Blood*. 2015;126(3):291-9.
AE, adverse event; AZA, azacitidine; GI, gastrointestinal.

	CC-486 n = 236		Placebo n = 233	
	All Grades	Grade 3–4	All Grades	Grade 3–4
Preferred term	n (%)			
Patients with ≥1 AE	**231 (98)**	**169 (72)**	**225 (97)**	**147 (63)**
Gastrointestinal				
Nausea	153 (65)	6 (3)	55 (24)	1 (0.4)
Vomiting	141 (60)	7 (3)	23 (10)	0
Diarrhea	119 (50)	12 (5)	50 (22)	3 (1)
Constipation	91 (39)	3 (1)	56 (24)	0
Hematologic				
Neutropenia	105 (45)	97 (41)	61 (26)	55 (24)
Thrombocytopenia	79 (34)	53 (23)	63 (27)	50 (22)

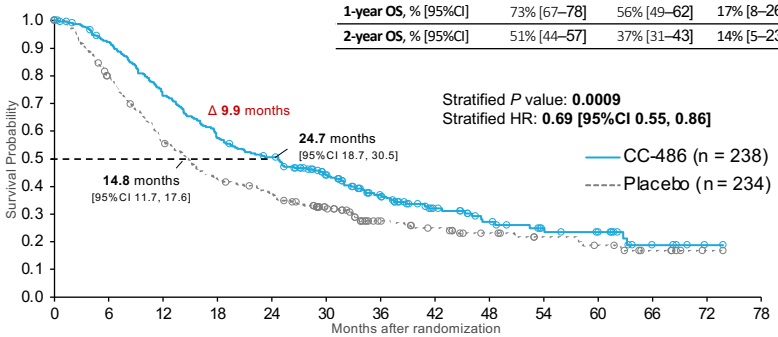
43

QUAZAR Trial – Primary Endpoint OS

- Median follow-up: 41.2 months

	CC-486	Placebo	Difference
1-year OS, % [95%CI]	73% [67–78]	56% [49–62]	17% [8–26]
2-year OS, % [95%CI]	51% [44–57]	37% [31–43]	14% [5–23]



Patients at risk:

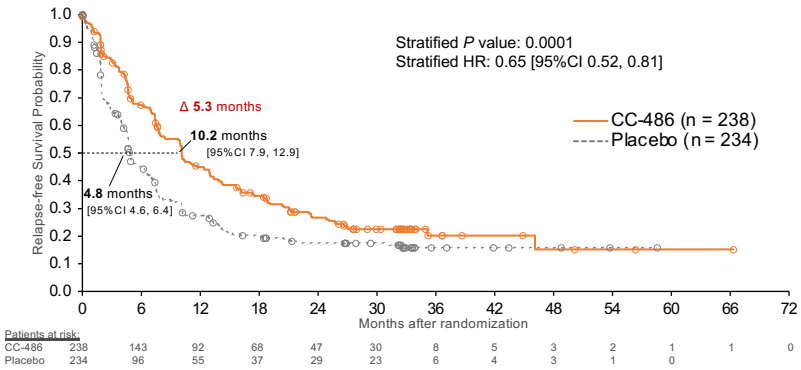
CC-486	238	213	169	133	115	87	59	37	26	18	15	5	1	0
Placebo	234	183	128	96	82	58	34	27	19	15	11	6	1	0

Data cutoff: July 15, 2019
OS was defined as the time from randomization to death by any cause. Kaplan-Meier estimated OS was compared for CC-486 vs. placebo by stratified log-rank test. HRs and 95%CIs were generated using a stratified Cox proportional hazards model.

Wei et al, ASH 2019. Abstr LBA 3.
Wei et al, NEJM 2020.

44

QUAZAR Trial – Secondary Endpoint RFS



- 1-year relapse rate was 53% in the CC-486 arm [95%CI 46, 59] and was 71% in the placebo arm [65, 77]

Data cutoff: July 15, 2019
RFS was defined as the time from randomization to relapse or death by any cause, whichever occurred first. Kaplan-Meier estimated RFS was compared for CC-486 vs. placebo by stratified log-rank test. HRs and 95%CIs were generated using a stratified Cox proportional hazards model.

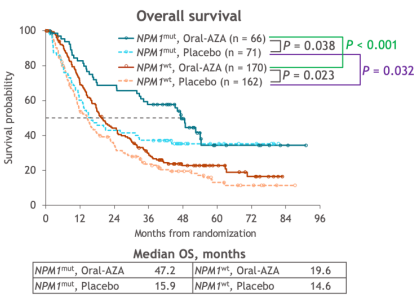
Wei et al, ASH 2019. Abstr LBA 3.
Wei et al, NEJM 2020.

45

QUAZAR AML-001 Trial: Effects of NPM1 and FLT3-ITD mutations

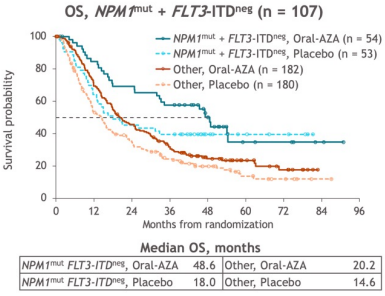
NPM1 mutational status at AML Dx was prognostic for OS and RFS, and predictive of a survival benefit for pts treated with Oral-AZA (vs. PBO).

Presence of *FLT3*-ITD at Dx had a negative prognostic influence, as suggested by differences in OS results in the PBO arm
Oral-AZA prolonged OS vs. PBO in pts with *NPM1*^{mut} + *FLT3*-ITD^{neg} (48.6 vs. 18.0 mo, respectively), and in pts with both *NPM1*^{mut} + *FLT3*-ITD (46.1 vs. 11.5 mo)



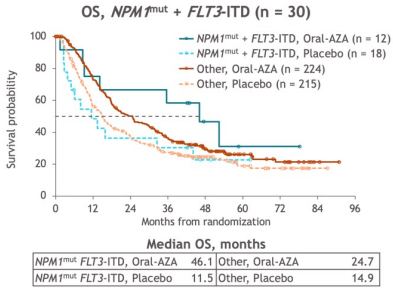
Median OS, months

NPM1^{mut}, Oral-AZA	47.2	*NPM1*^{wt}, Oral-AZA	19.6
NPM1^{mut}, Placebo	15.9	*NPM1*^{wt}, Placebo	14.6



Median OS, months

NPM1^{mut} *FLT3-ITD*^{neg}, Oral-AZA	48.6	Other, Oral-AZA	20.2
NPM1^{mut} *FLT3-ITD*^{neg}, Placebo	18.0	Other, Placebo	14.6



Median OS, months

NPM1^{mut} *FLT3*-ITD, Oral-AZA	46.1	Other, Oral-AZA	24.7
NPM1^{mut} *FLT3*-ITD, Placebo	11.5	Other, Placebo	14.9

Döhner et al, EHA 2021. Abstr S131.

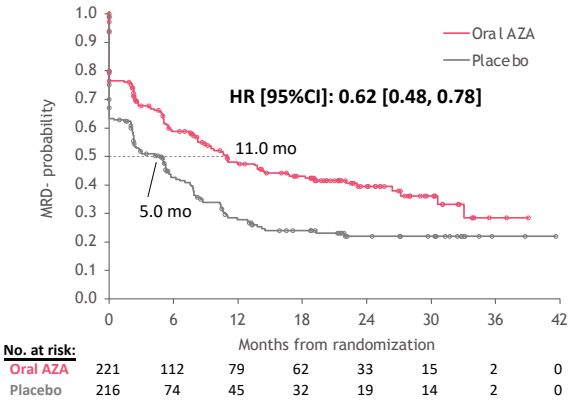
46

QUAZAR AML-001: MRD Responses

- Oral AZA was associated with a higher rate of MRD response (BL MRD+, became MRD- on-study) vs. PBO: 37% vs. 19%, respectively

MRD Response	Oral AZA	Placebo
MRD+ at screening, n	**103**	**116**
MRD responders, n/N (%)	**38/103 (37%)**	**22/116 (19%)**
Time to MRD response,[a] n/N (%)		
> 3 to ≤ 6 months	7/38 (18%)	6/22 (27%)
> 6 months	9/38 (24%)	1/22 (5%)

- The median duration of MRD negativity overall (BL MRD– and MRD responders) was extended with Oral AZA vs. PBO



[a]Time from MRD assessment at screening.
95%CI, 95% confidence interval; AZA, azacitidine; BL, baseline; HR, hazard ratio; mo, months; MRD, measurable residual disease; PBO, placebo.

Roboz et al, ASH 2020 Abstract #692

47

Case 5

A 55-year-old woman was diagnosed with AML with del(9q) and mutations in CEBPA (biallelic), GATA2 and WT1. She achieved an MFC MRD negative CR with negative molecular studies after induction with 7+3 plus GO. She completed consolidation with HiDAC and transplant was deferred. BMBx after consolidation again confirmed MRD negative CR with negative molecular studies.

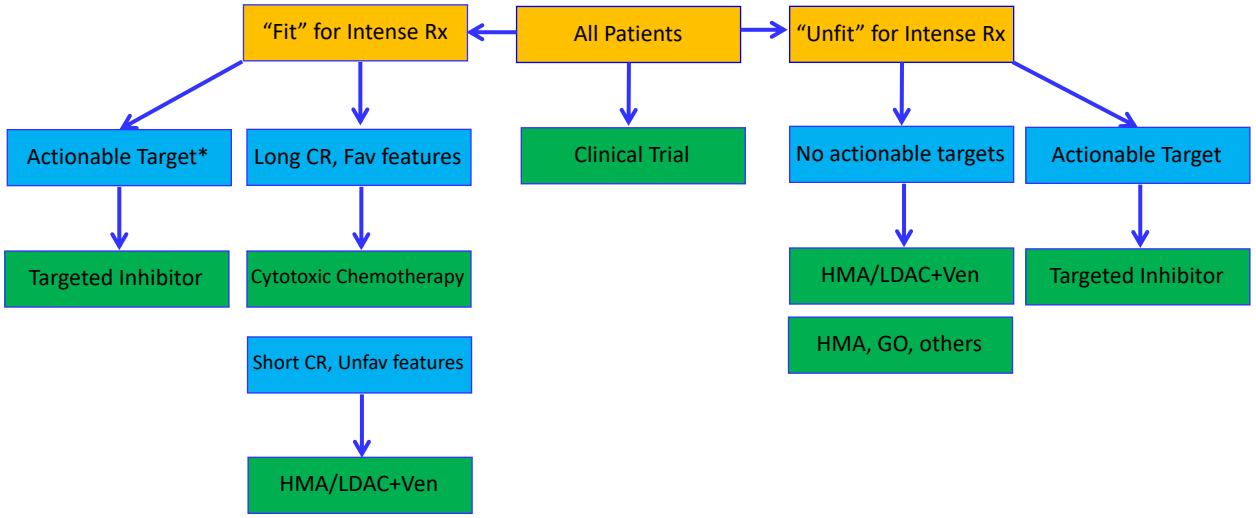
13 months after achieving CR, she presented with mild neutropenia and thrombocytopenia and flow on the PB flow revealed reappearance of abnormal myeloblasts. A BMBx showed relapsed AML with 30% blasts. Cytogenetics and an NGS-based myeloid mutation panel again showed del(9q) and mutations in CEBPA (biallelic), GATA2 and WT1.

What are the typical approaches to treating r/r AML?

What are some of the newer agents and approaches being incorporated?

48

Current Options for the Treatment of r/r AML

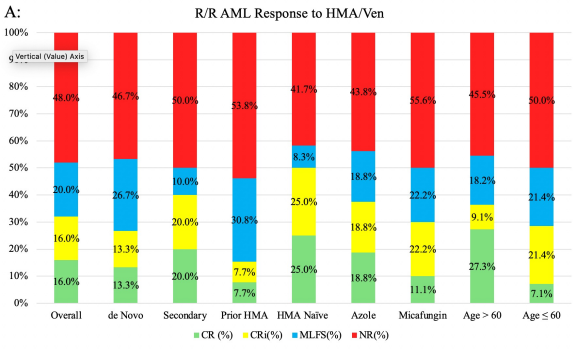


49

HMA plus Venetoclax in r/r AML

- ORR 19% for Ven monotherapy and around 15-20% for Aza monotherapy in r/r AML
- Meta-analysis: ORR 38.7% (31.1% for prior HMA), CR/CRi 32.8%, CR 19% for Ven+HMA/LDAC

UCD Experience:



CR/CRi 50+% with IDH1/2, NPM1 and FLT3-ITD mutations

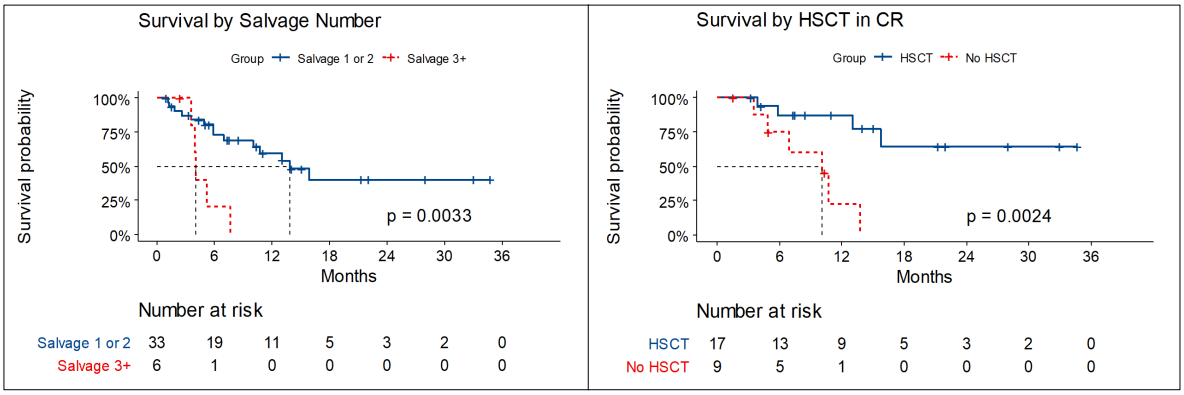
Tenold et al, Clin Lymph Myelo & Leuk 2021.

52

FLAG-Ida-Ven: OS by Salvage and After Allo-HCT for r/r AML

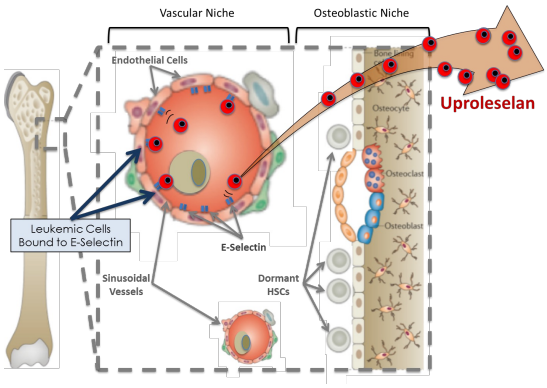


46% bridged to allo-HCT
12mo OS 87%

DiNardo et al, JCO 2021 and ASH 2020.

53

E-Selectin Inhibition with Uproleselan (GMI-1271) in AML



E-selectin –

- An Adhesion molecule constitutively expressed on endothelial cells in the bone marrow microvasculature
- Binds to the E-selectin ligands (Sialyl $Le^{a/x}$) on AML cells
- Promotes environment-mediated drug resistance (EMDR) of leukemic cell

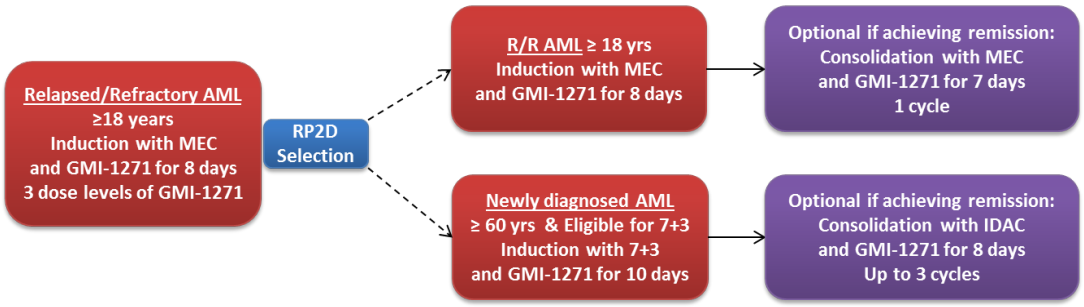
Uproleselan, an E-selectin antagonist –

- Inhibits activation of cancer survival pathways (e.g. NF-KB), disrupting EMDR within bone marrow
- Prolongs survival over chemotherapy alone in animal models
- Protects normal HSCs by enhancing quiescence and ability for self-renewal
- Reduces chemotherapy-associated mucositis

Barbier, et al, Nature Communications 2020.

54

Phase 1/2 Uproleselan Study Schema



DeAngelo et al, Blood 2022.

55

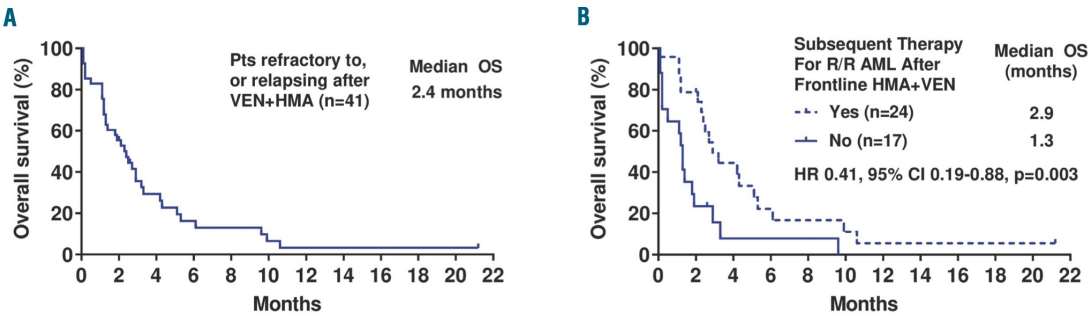
Wang et al, ASH 2020 Abstract # 115.

60

R/R AML after Ven-HMA has Very Poor Outcomes



- **New major unmet medical need**
- When there is no targetable mutation and no trial option, I have tried chemotherapy, GO, Cladribine-LDAC-/+Ven, continuing Ven-HMA with dose adjustments
- Clinical trials are needed to advance the field: Mcl1i, activated kinase pathway inhibition, TP53-targeting agents, immunotherapy, and other approaches; do we re-use Ven in a new combo?

Maiti et al, Haematologica 2021.

61

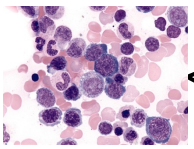
Case 6

A 78-year-old man was diagnosed with MDS after presenting with fatigue and macrocytic anemia. He is relatively healthy overall. CBC showed WBC 2, Hgb 7, Plt 75, and ANC 700. BMBx showed 8% blasts, del(5q) and a mutation in DNMT3A. His IPSS-R score is 5.5pts or high risk. He is interested in treatment of his MDS and his hematologist recommends standard azacitidine 75mg/m2 SQ for 7 days every 28 days.

He is interested in seeing if there is an oral option to treat his high risk MDS since he lives relatively far from the nearest infusion center.

62

Treatment Approaches in MDS



Diagnosis of MDS

	Treatment Goal	Treatment Options
Higher Risk: IPSS-R Int*, HR, VHR	Alter disease natural history	• Hypomethylating agents (HMA) -/+ Ven • High-intensity chemotherapy (IC) • Allogeneic HCT • Clinical Trial
Lower Risk: IPSS-R VLR, LR, Int	Hematologic improvement	• Growth factors • Luspatercept • Lenalidomide • Immune suppressive therapy (IST) • HMA • Watch and Wait • Clinical Trial

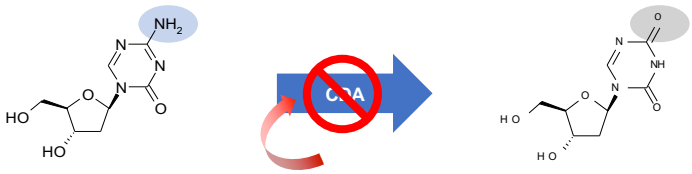
* IPSS-R score > 3.5 points

Based on NCCN Guidelines, MDS, v 3.2022.

63

Oral Decitabine + Cedazuridine (DEC-C)

- Current HMA treatment poses significant patient burden due to 5–7 days per month of parenteral administration in a clinic setting
- Oral bioavailability of HMAs decitabine and azacitidine is limited due to rapid degradation by CDA in the gut and liver



Decitabine | **CDA inhibitor** | **Inactive metabolite**

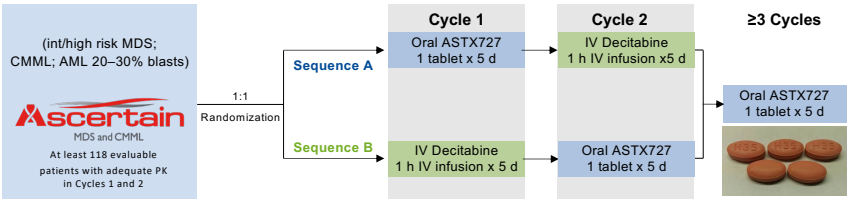
- Cedazuridine is a novel, potent, and safe CDA inhibitor
  - Large safety margin, with no adverse events at up to 200 mg/kg in monkeys (~2400 mg/m^2 human equivalent)

CDA, cytidine deaminase.

Savona et al. Lancet Hematogy 2019.

64

ASTX727-02 trial of DEC-C in MDS/CMML: Randomized Cross-Over Trial



Major entry criteria
- Candidates for IV decitabine
- ECOG PS 0–1
- Life expectancy of ≥3 months
- Adequate Organ Function
- One prior cycle of HMA is allowed

Primary endpoint
- Total 5-d decitabine AUC equivalence (Oral/IV 90% CI between 80% and 125%)

Secondary endpoints
- Efficacy: Response rate; Transfusion independence; duration of response; Leukemia-free and overall survival
- Safety of ASTX727
- Max LINE-1 demethylation

Garcia-Manero et al. Abstract 846 ASH 2019

65

ASTX727-02 Primary Endpoint: 5-day Decitabine AUC Equivalence

Decitabine 5-day $AUC_{0\text{-}24}$ (h·ng/mL)		IV DEC N	IV DEC Geo. LSM	Oral ASTX727 N	Oral ASTX727 Geo. LSM	Ratio of Geo. LSM Oral/IV, % (90% CI)	Intrasubject (%CV)
Primary Analysis	Paired[1]	123	864.9	123	855.7	98.9 (92.7, 105.6)	31.7

[1] Paired patient population: patients who received both ASTX727 and IV decitabine in the randomized first 2 cycles with adequate PK samples.

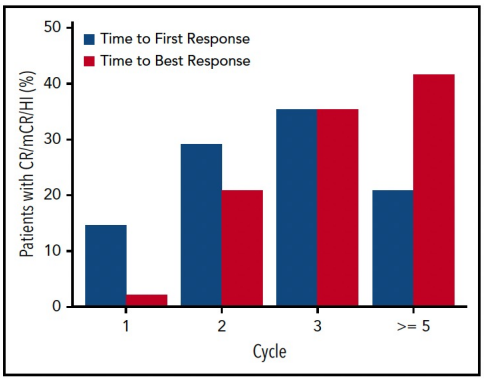
- Study met its primary endpoint with high confidence: Oral/IV 5-day decitabine AUC ~99% with 90% CI of ~93-106%
- All Sensitivity and secondary PK AUC analyses confirmed findings from primary analysis

Garcia-Manero et al. Abstract 846 ASH 2019

66

ASTX727-01-B: DEC-C Responses in MDS/CMML

Type of response	Phase 2 overall (N = 80)	
	n (%)	95% CI
CR	17 (21)	13-32
PR	0	
mCR mCR with HI	18 (22) 6 (7)	14-33 3-16
HI HI-E HI-N HI-P	13 (16) 8 (10) 2 (2) 11 (14)	9-26 4-19 0-9 7-23
Overall response* (CR + PR + mCR + HI)	48 (60)	48-71
No response	32 (40)	29-52



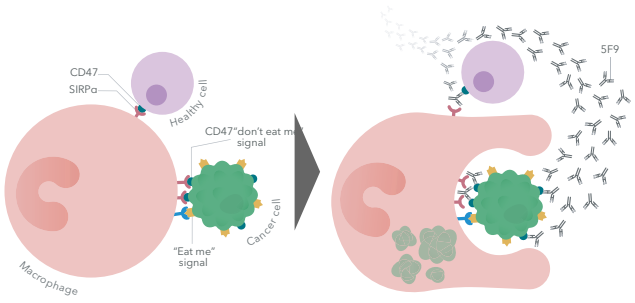
- Comparable safety was seen between IV decitabine and PO DEC-C

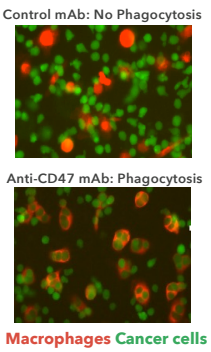
Garcia-Manero et al. Blood 2020.

67

Magrolimab for MDS and AML: MOA

- Magrolimab (Formerly 5F9) is a First-in-class Macrophage Immune Checkpoint Inhibitor Targeting CD47



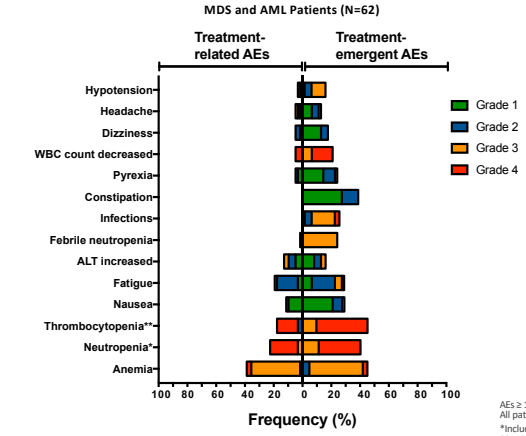


- Magrolimab is an IgG4 anti-CD47 monoclonal antibody being investigated in multiple cancers
- Magrolimab was well tolerated in a UK Phase 1 trial in r/r AML with no MTD reached (Vyas et al., EHA abs 2018)

Sallman et al, ASH 2019. Abstr 569.

68

Magrolimab for MDS and AML: Safety



- No MTD was reached; magrolimab+AZA profile consistent with AZA monotherapy
- No significant cytopenias, infections, or autoimmune AEs were observed (most patients cytopenic at baseline)
- No deaths were observed in the first 60 days on therapy
- Treatment discontinuation due to AE occurred in only 1 of 62 (1.6%) of all patients treated with magrolimab + AZA

AEs ≥ 15% or AEs of interest are shown
All patients with at least one magrolimab dose are shown
*Includes neutropenia and neutrophil count decreased
**Includes thrombocytopenia and platelet count decreased

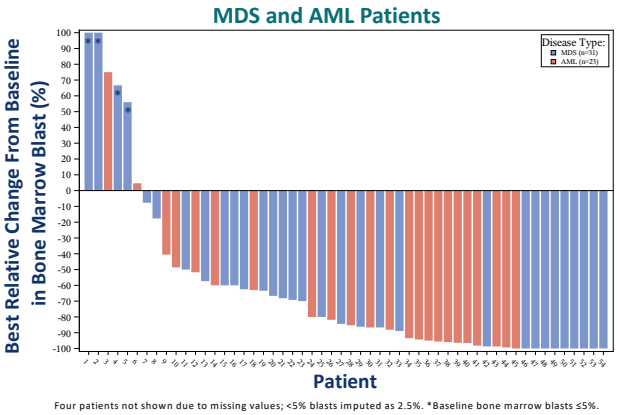
Sallman et al, ASH 2019. Abstr 569.

69

Magrolimab for MDS and AML: Activity

Best Overall Response	1L MDS N=33	1L AML N=25
ORR	30 (91%)	16 (64%)
CR	14 (42%)	10 (40%)
CRi	NA	4 (16%)
PR	1 (3%)	1 (4%)
MLFS/marrow CR	8 (24%) 4 with marrow CR + HI	1 (4%)
Hematologic improvement (HI)	7 (21%)	NA
SD	3 (9%)	8 (32%)
PD	0	1 (4%)

Response assessments per 2006 IWG MDS criteria and 2017 AML ELN criteria. Patients with at least 1 post-treatment response assessment are shown; all other patients are on therapy and are too early for first response assessment, except for 2 MDS patients not evaluable (withdrawal of consent) and 3 AML patients (1 AE, 2 early withdrawal).



Four patients not shown due to missing values; <5% blasts imputed as 2.5%. *Baseline bone marrow blasts ≤5%.

- Magrolimab + AZA induces a 91% ORR (42% CR) in MDS and 64% ORR (56% CR/CRi) in AML
- Responses deepened over time with a 56% 6-month CR rate in MDS patients (assessed in all patients 6 months after initial treatment)
- Median time to response is 1.9 months, more rapid than AZA alone
- Magrolimab + AZA efficacy compares favorably to AZA monotherapy (CR rate 6-17%[1,2])

International Prognostic Scoring System – Molecular

Table 1. IPSS-M Risk Score Construction from an Adjusted Cox Multivariable Regression for Leukemia-Free Survival.*

Category and Variable	Adjusted Hazard Ratio (95% CI)†	Model Weight‡
Clinical		
Bone marrow blasts — %	1.07 (1.05–1.09)	0.0704
min(Platelets,250) — x10^9/l	0.998 (0.997–0.999)	−0.00222
Hemoglobin — g/dl	0.84 (0.81–0.88)	−0.171
Cytogenetic		
IPSS-R cytogenetic category§	1.33 (1.21–1.47)	0.287
Gene main effects (17 variables, 16 genes)¶		
TP53^{multhit}	3.27 (2.38–4.48)	1.18
MLL^{PTD}	2.22 (1.49–3.32)	0.798
FLT3$^{ITD+TKD}$	2.22 (1.11–4.45)	0.798
SF3B1^{5q}	1.66 (1.03–2.66)	0.504
NPM1	1.54 (0.78–3.02)	0.430
RUNX1	1.53 (1.23–1.89)	0.423
NRAS	1.52 (1.05–2.20)	0.417
ETV6	1.48 (0.98–2.23)	0.391
IDH2	1.46 (1.05–2.02)	0.379
CBL	1.34 (0.99–1.82)	0.295
EZH2	1.31 (0.98–1.75)	0.270
U2AF1	1.28 (1.01–1.61)	0.247
SRSF2	1.27 (1.03–1.56)	0.239
DNMT3A	1.25 (1.02–1.53)	0.221
ASXL1	1.24 (1.02–1.51)	0.213
KRAS	1.22 (0.84–1.77)	0.202
SF3B1$^{\alpha}$	0.92 (0.74 1.16)	−0.0794
Gene residuals (1 variable, 15 genes; possible values of 0, 1, or 2)‖		
min(Nres,2)	1.26 (1.12–1.42)	0.231

* CI denotes confidence interval; IPSS-M, International Prognostic Scoring System–Molecular; IPSS-R, International Prognostic Scoring System–Revised; ITD, internal tandem duplication; min, minimum; PTD, partial tandem duplication; and TKD tyrosine kinase domain.

† Hazard ratio is for the risk of leukemic transformation or death, adjusted for age, sex, and secondary/therapy-related versus primary myelodysplastic syndrome. Cox regression was performed for 2428 patients with available covariables and leukemia-free survival data.

‡ Model weights were derived from the logarithm of the raw hazard ratios up to three significant digits. The following formula applies: IPSS-M score = $1.15467 \times \sum_{variables\ j} w_j x_j / \log(2)$, where w_j denotes the weight of variable j and x_j the value of the variable j observed in a given patient.

§ IPSS-R cytogenetic categories were as follows: 0 denotes very good, 1 good, 2 intermediate, 3 poor, and 4 very poor.

¶ *SF3B1*^{5q} is the *SF3B1* mutation in the presence of isolated del(5q) — that is, del(5q) only or with one additional aberration excluding -7/del(7q). *SF3B1*$^{\alpha}$ is the *SF3B1* mutation without comutations in *BCOR, BCORL1, RUNX1, NRAS, STAG2, SRSF2,* and del(5q).

‖ Nres is defined as the number of mutated genes within the following list: *BCOR, BCORL1, CEBPA, ETNK1, GATA2, GNB1, IDH1, NF1, PHF6, PPM1D, PRPF8, PTPN11, SETBP1, STAG2,* and *WT1*. The variable min(Nres,2) can therefore take the value 0, 1, or 2.

Bernard et al, NEJM Evidence 2022.

Dohner et al, Blood 2022

76

WHO 2022 - MDS

Table 3. Classification and defining features of myelodysplastic neoplasms (MDS).

	Blasts	Cytogenetics	Mutations
MDS with defining genetic abnormalities			
MDS with low blasts and isolated 5q deletion (MDS-5q)	<5% BM and <2% PB	5q deletion alone, or with 1 other abnormality other than monosomy 7 or 7q deletion	
MDS with low blasts and *SF3B1* mutation[a] (MDS-*SF3B1*)		Absence of 5q deletion, monosomy 7, or complex karyotype	*SF3B1*
MDS with biallelic *TP53* inactivation (MDS-bi*TP53*)	<20% BM and PB	Usually complex	Two or more *TP53* mutations, or 1 mutation with evidence of *TP53* copy number loss or cnLOH
MDS, morphologically defined			
MDS with low blasts (MDS-LB)	<5% BM and <2% PB		
MDS, hypoplastic[b] (MDS-h)			
MDS with increased blasts (MDS-IB)			
MDS-IB1	5–9% BM or 2–4% PB		
MDS-IB2	10-19% BM or 5–19% PB or Auer rods		
MDS with fibrosis (MDS-f)	5–19% BM; 2–19% PB		

[a]Detection of ≥15% ring sideroblasts may substitute for *SF3B1* mutation. Acceptable related terminology: MDS with low blasts and ring sideroblasts.
[b]By definition, ≤25% bone marrow cellularity, age adjusted.
BM bone marrow, *PB* peripheral blood, *cnLOH* copy neutral loss of heterozygosity.

Khoury et al, Leukemia 2022

77

ICC - MDS

Table 20. Myelodysplastic syndromes (MDS) and myelodysplastic syndrome/acute myeloid leukemia (MDS/AML)

	Dysplastic lineages	Cytopenias	Cytoses*	BM and PB Blasts	Cytogenetics[b]***	Mutations
MDS with mutated *SF3B1* (MDS-*SF3B1*)	Typically ≥1[c]	≥1	0	<5% BM <2% PB	Any, except isolated del(5q), -7/del(7q), abn3q26.2, or complex	*SF3B1* (≥10% VAF), without multi-hit *TP53*, or *RUNX1*
MDS with del(5q) [MDS-del(5q)]	Typically ≥1[c]	≥1	Thrombocytosis allowed	<5% BM <2% PB[d]	del(5q), with up to 1 additional, except -7/del(7q)	Any, except multi-hit *TP53*
MDS, NOS - without dysplasia	0	≥1	0	<5% BM <2% PB[d]	-7/del(7q) or complex	Any, except multi-hit *TP53* or *SF3B1* (≥10% VAF)
MDS, NOS - with single lineage dysplasia	1	≥1	0	<5% BM <2% PB[d]	Any, except not meeting criteria for MDS-del(5q)	Any, except multi-hit *TP53*;not meeting criteria for MDS-*SF3B1*
MDS, NOS - with multilineage dysplasia	≥2	≥1	0	<5% BM <2% PB[d]	Any, except not meeting criteria for MDS-del(5q)	Any, except multi-hit *TP53*,; not meeting criteria for MDS-*SF3B1*
MDS with excess blasts (MDS-EB)	Typically ≥1[c]	≥1	0	5-9% BM, 2-9% PB[d]	Any	Any, except multi-hit *TP53*
MDS/AML	Typically ≥1[c]	≥1	0	10-19% BM or PB[e]	Any, except AML-defining[f]	Any, except *NPM1*, bZIP *CEBPA* or *TP53*

[a]Cytoses: Sustained white blood count ≥13 x 10^9/L, monocytosis (≥0.5 x 10^9/L and ≥10% of leukocytes), or platelets ≥450 x 10^9/L; thrombocytosis is allowed in MDS-del(5q) or in any MDS case with inv(3) or t(3;3) cytogenetic abnormality.
[b]*BCR::ABL1* rearrangement or any of the rearrangements associated with myeloid/lymphoid neoplasms with eosinophilia and tyrosine kinase gene fusions exclude a diagnosis of MDS, even in the context of cytopenia.
[c]Although dysplasia is typically present in these entities, it is not required.
[d]Although 2% PB blasts mandates classification of an MDS case as MDS-EB, the presence of 1% PB blasts confimed on two separate occasions also qualifies for MDS-EB.
[e]For pediatric patients (<18 years), the blast thresholds for MDS-EB are 5-19% in BM and 2-19% in PB, and the entity MDS/AML does not apply.
[f]AML-defining cytogenetics are listed in the AML section.

Arber et al, Blood 2022

78

WHO 2022 – AML

Table 7. Acute myeloid leukaemia.

Acute myeloid leukaemia with defining genetic abnormalities
Acute promyelocytic leukaemia with *PML::RARA* fusion
Acute myeloid leukaemia with *RUNX1::RUNX1T1* fusion
Acute myeloid leukaemia with *CBFB::MYH11* fusion
Acute myeloid leukaemia with *DEK::NUP214* fusion
Acute myeloid leukaemia with *RBM15::MRTFA* fusion
Acute myeloid leukaemia with *BCR::ABL1* fusion
Acute myeloid leukaemia with *KMT2A* rearrangement
Acute myeloid leukaemia with *MECOM* rearrangement
Acute myeloid leukaemia with *NUP98* rearrangement
Acute myeloid leukaemia with *NPM1* mutation
Acute myeloid leukaemia with *CEBPA* mutation
Acute myeloid leukaemia, myelodysplasia-related
Acute myeloid leukaemia with other defined genetic alterations
Acute myeloid leukaemia, defined by differentiation
Acute myeloid leukaemia with minimal differentiation
Acute myeloid leukaemia without maturation
Acute myeloid leukaemia with maturation
Acute basophilic leukaemia
Acute myelomonocytic leukaemia
Acute monocytic leukaemia
Acute erythroid leukaemia
Acute megakaryoblastic leukaemia

Summary Box:

- AML is arranged into two families: AML with *defining genetic abnormalities* and AML *defined by differentiation*. AML, NOS is no longer applicable.
- Most AML with defining genetic abnormalities may be diagnosed with <20% blasts.
- AML-MR replaces the former term AML "with myelodysplasia-related changes", and its diagnostic criteria are updated. AML transformation of MDS and MDS/MPN continues to be defined under AML-MR in view of the broader unifying biologic features.
- AML with rare fusions are incorporated as subtypes under AML with *other defined genetic alterations*.
- AML with somatic *RUNX1* mutation is not recognized as a distinct disease type due to lack of sufficient unifying characteristics.

Summary Box:

- Myeloid neoplasms (MDS, MDS/MPN, and AML) *post cytotoxic therapy* (MN-pCT) require full diagnostic work up; the term replaces *therapy-related*.
- Exposure to PARP1 inhibitors is added as a qualifying criterion for MN-pCT.
- The diagnostic framework for myeloid neoplasm associated with germline predisposition is restructured along a scalable model that can accommodate future refinement and discoveries.

Khoury et al, Leukemia 2022

79

ICC - AML

AML and related neoplasms
AML with recurrent genetic abnormalities (requiring ≥10% blasts in BM or PB)[a]
• APL with t(15;17)(q24.1;q21.2)/*PML::RARA*[b]
• AML with t(8;21)(q22;q22.1)/*RUNX1::RUNX1T1*
• AML with inv(16)(p13.1q22) or t(16;16)(p13.1;q22)/*CBFB::MYH11*
• AML with t(9;11)(p21.3;q23.3)/*MLLT3::KMT2A*[c]
• AML with t(6;9)(p22.3;q34.1)/*DEK::NUP214*
• AML with inv(3)(q21.3q26.2) or t(3;3)(q21.3;q26.2)/*GATA2, MECOM(EVI1)*[d]
• AML with other rare recurring translocations[e]
• AML with mutated *NPM1*
• AML with in-frame bZIP mutated *CEBPA*[f]
• AML with t(9;22)(q34.1;q11.2)/*BCR::ABL1*[a]
Categories designated AML (if ≥20% blasts in BM or PB) or MDS/AML (if 10-19% blasts in BM or PB)
• AML with mutated *TP53*[g]
• AML with myelodysplasia-related gene mutations Defined by mutations in *ASXL1, BCOR, EZH2, RUNX1, SF3B1, SRSF2, STAG2, U2AF1,* or *ZRSR2*
• AML with myelodysplasia-related cytogenetic abnormalities[h]
• AML not otherwise specified (NOS)
Myeloid sarcoma
Myeloid proliferations related to Down Syndrome
• Transient abnormal myelopoiesis associated with Down syndrome
• Myeloid leukemia associated with Down syndrome
Blastic plasmacytoid dendritic cell neoplasm
Acute leukemias of ambiguous lineage
• Acute undifferentiated leukemia
• MPAL with t(9;22)(q34.1;q11.2)/*BCR::ABL1*
• MPAL with t(v;11q23.3)/*KMT2A* rearranged
• MPAL, B/myeloid, not otherwise specified
• MPAL, T/myeloid, not otherwise specified

Table 27. Diagnostic qualifiers that should be used following a specific MDS, AML (or MDS/AML) diagnosis*

Therapy-related** • prior chemotherapy, radiotherapy, immune interventions
Progressing from myelodysplastic syndrome • MDS should be confirmed by standard diagnostics
Progressing from myelodysplastic/myeloproliferative neoplasm (specify) • MDS/MPN should be confirmed by standard diagnostics
Germline predisposition

*Examples: Acute myeloid leukemia with myelodysplasia-related cytogenetic abnormality, therapy-related; acute myeloid leukemia with myelodysplasia-related gene mutation, progressed from myelodysplastic syndrome; AML with myelodysplasia-related gene mutation, germline *RUNX1* mutation

**lymphoblastic leukemia/lymphoma may also be therapy-related, and that association should also be noted in the diagnosis

Arber et al, Blood 2022
Dohner et al, Blood 2022

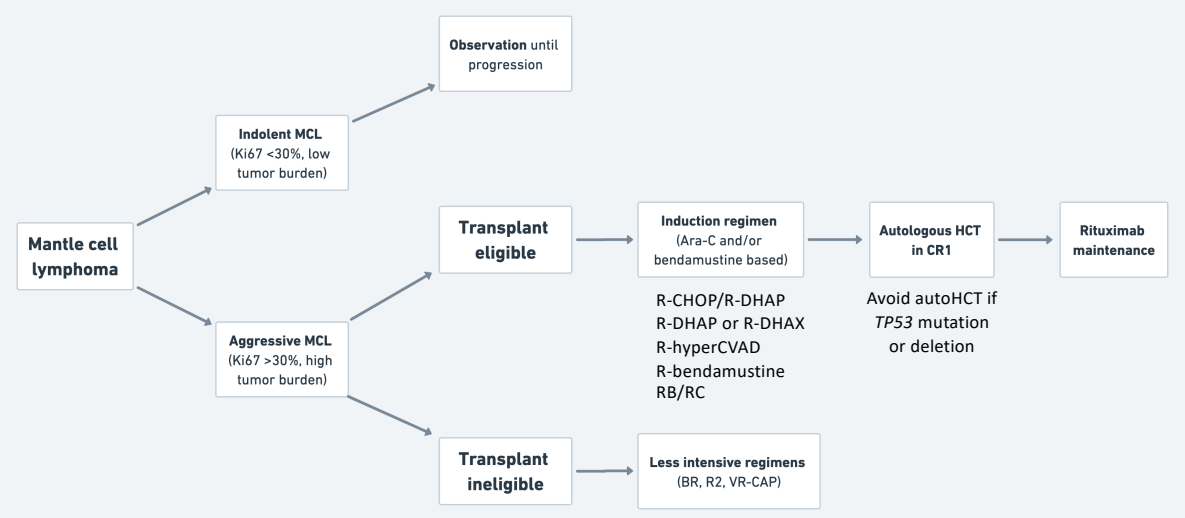
16

DLBCL updates – Summary

- Pola-R-CHP is a new frontline option for high-risk DLBCL with IPI 2-5
  - PFS benefit over R-CHOP but similar OS
  - Greater benefit in older adults >60, IPI 3-5, and non-GCB subtype
  - Similar safety profile but much greater financial toxicity with pola-R-CHP
- Many trials are integrating novel agents into frontline therapy, including anti-CD20 BiTEs, Tafa/Len, and acalabrutinib added to an R-CHOP backbone
- Patients with **primary refractory DLBCL and early relapse within 1 year** have poor outcomes with salvage chemotherapy and autoHCT (median OS ~6-8 months)
  - CD19 CAR-T (Axi-cel or Liso-cel) is the new SOC for this patient population
- Patients with late relapse >2 years have favorable outcomes with salvage chemotherapy and autoHCT

17

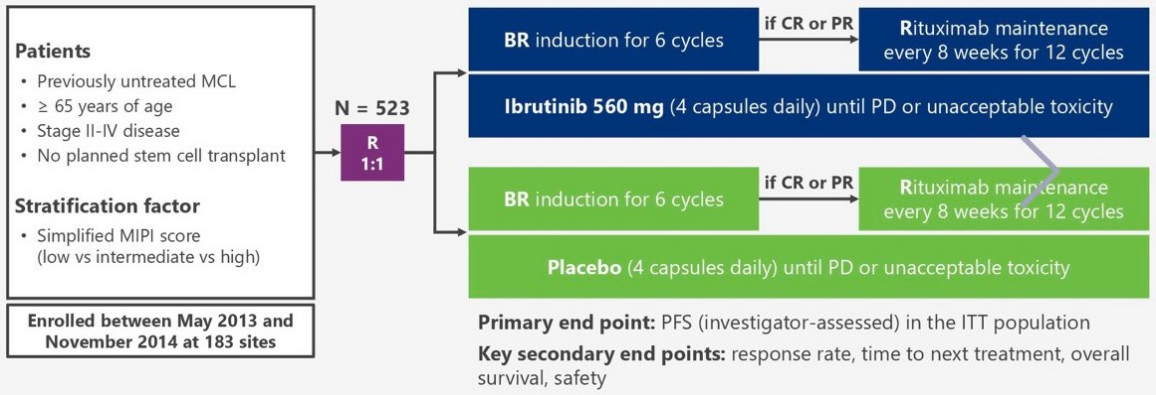
Mantle cell lymphoma – frontline therapy



18

SHINE trial

- Phase 3 trial evaluating **BR with or without ibrutinib** in older adults with transplant ineligible MCL



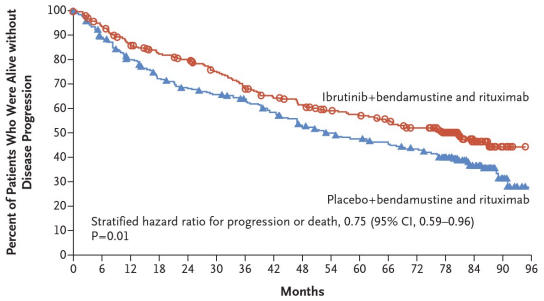
Wang et al, NEJM 2022

19

SHINE trial – efficacy endpoints

- Adding ibrutinib to BR improved PFS but not OS
- Median PFS 80.6 months vs 52.9 months (median follow-up 84.7 months)

Progression-free survival



BR + ibrutinib	261	228	207	191	182	167	152	139	130	120	115	106	95	78	39	11	0

22

Limitations of the SHINE trial

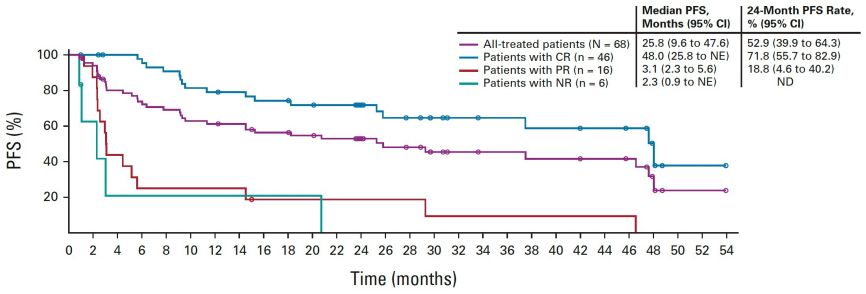
- Adding ibrutinib to BR improved PFS but increased toxicity (including financial toxicity)
- The lack of an OS benefit suggests that sequential therapy with BR followed by ibrutinib may be as effective with less toxicity
- Newer generation BTK inhibitors (acalabrutinib and zanubrutinib) appear less toxic than ibrutinib with comparable efficacy and may be better options for sequential therapy in some patients[1]
  - Phase 3 ASPEN trial comparing ibrutinib vs zanubrutinib in LPL/WM demonstrated lower rates of Afib, bleeding, pneumonia, diarrhea, and edema in the zanubrutinib arm[2]
- Two Phase 3 trials (ECHO and MANGROVE) are evaluating BR + acalabrutinib or BR + zanubrutinib, respectively, as frontline therapy for older adults with MCL

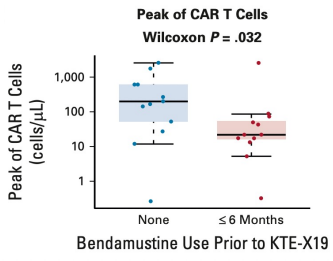
[1]Byrd et al, JCO 2021 [2]Tam et al, Blood 2020

23

ZUMA-2 trial 3-year update – Brexu-cel in R/R MCL

- Enrolled 68 patients with R/R MCL after BTK inhibitor; received Flu/Cy → Brexu-cel (2 x 10^6 CAR T cells/kg)
- ORR 91%, CR 68%, median PFS 25.8 months at 3-year follow-up
- Active in high-risk subgroups including TP53 mutation, Ki67 >50%, and blastoid/pleomorphic MCL
- Grade 3-4 CRS and ICANS occurred in 15% and 31%, respectively
- Poorer CAR-T expansion and inferior outcomes with prior bendamustine <6 months before CAR-T





Wang et al, JCO 2022

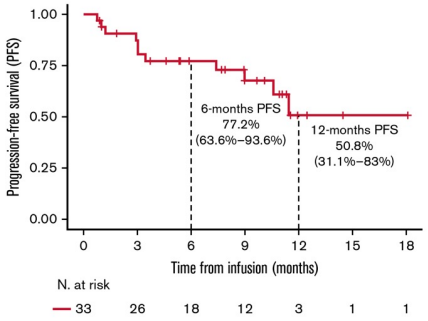
24

Real world experience with Brexu-cel in R/R MCL

- U.S. CAR-T consortium – 167 patients from 16 centers
- High risk patient population:
  - Median age 67 years
  - Median 3 prior therapies (86% prior BTK inhibitor)
  - 57% had Ki67 >50%
  - 49% had TP53 mutation or deletion
  - 10% had CNS involvement
  - 78% would not have met eligibility criteria for ZUMA-2
- Median time from apheresis to LD chemo: 28 days
- Safety/tolerability:
  - CRS 90% (grade 3+ 8%) – 1 fatality
  - ICANS 61% (grade 3+ 32%)
- Efficacy:
  - ORR 89%, CR 70%
  - 6-month PFS 63% (median follow-up 6 months)

Jain et al, ASCO 2022

- Similar real world outcomes from Europe:
  - 33 patients from 11 centers
  - ORR 91%, CR 79%
  - 1-year PFS 51%

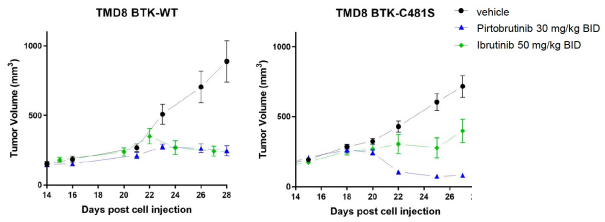


Iacoboni et al, *Blood Adv* 2022

25

BRUIN trial – Pirtobrutinib (LOXO-305) in R/R MCL

- Pirtobrutinib (LOXO-305) is an oral, highly selective, non-covalent BTK inhibitor
  - ➢ Similar activity to ibrutinib, but retains activity in patients with BTK C481S mutation



- Phase 1/2 BRUIN trial evaluated pirtobrutinib in R/R CLL, MCL, and other B-cell NHL
- MCL cohort enrolled BTKi refractory and naïve patients

Characteristics	MCL (n=134)

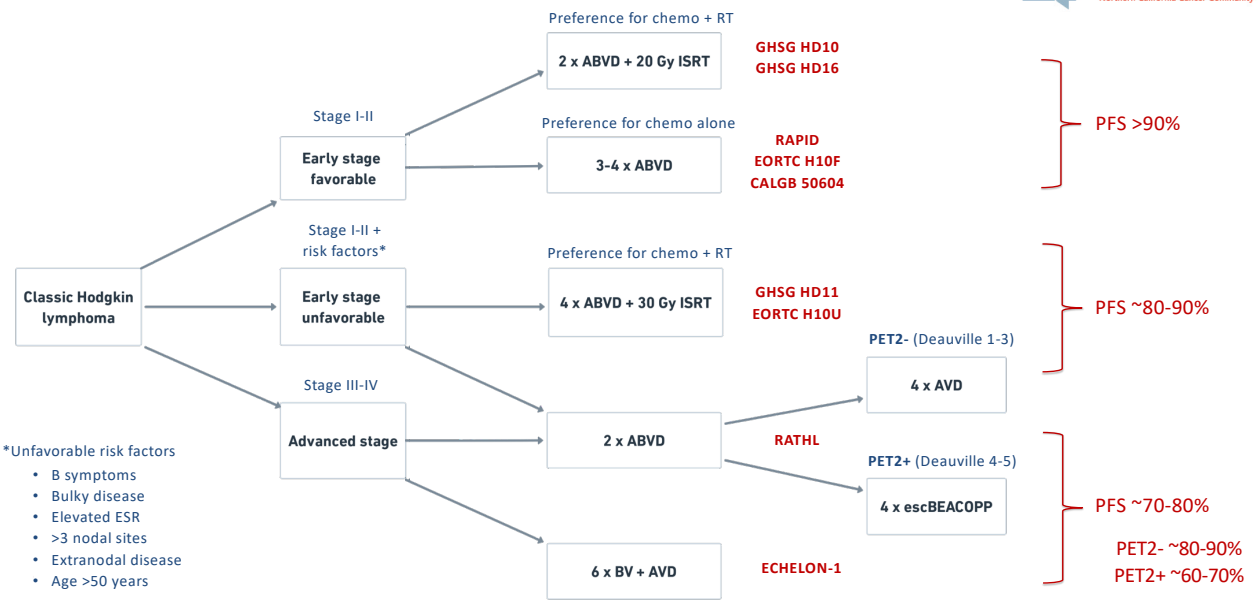
30

Mantle cell lymphoma updates - Summary

- In older adults with transplant ineligible MCL, adding ibrutinib to BR improves PFS but increases toxicity
  - The lack of an OS benefit suggests that sequential therapy with BR followed by a BTKi at relapse may be as effective with less toxicity
- CAR T-cell therapy (Brexu-cel) is highly active for R/R MCL progressing after a BTKi
  - 3-year follow-up from ZUMA-2 demonstrates durable remissions for patients achieving CR
  - Real world data from the U.S. and Europe demonstrate a similar efficacy/safety profile as ZUMA-2
- Pirtobrutinib (LOXO-305) is an active oral therapy for R/R MCL progressing on a covalent BTKi
  - Phase 3 BRUIN MCL-321 trial will compare pirtobrutinib vs investigator's choice of covalent BTKi
- Several novel drug classes appear promising in multiply R/R MCL including anti-CD20/CD3 BiTEs, PI3Ki, ROR1 ADC, and BCL2 inhibitors alone or in combination with pirtobrutinib

31

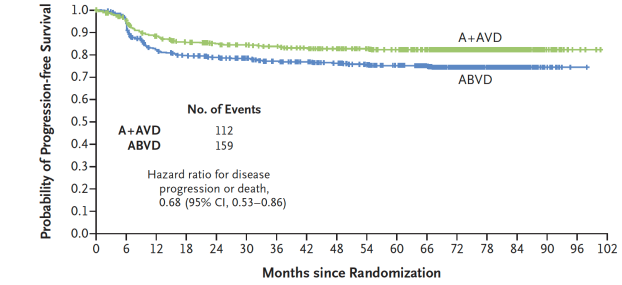
Hodgkin lymphoma – frontline therapy

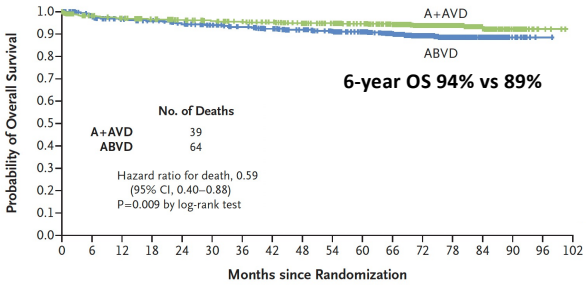


32

ECHELON-1 6-year update

- Phase 3 trial randomizing 1,334 patients with stage III-IV HL to receive 6 cycles of ABVD or BV-AVD
- At median follow-up >6 years, PFS and OS were both superior in the BV-AVD arm



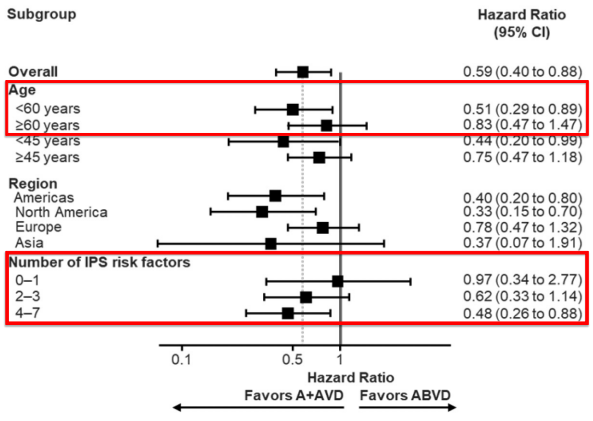


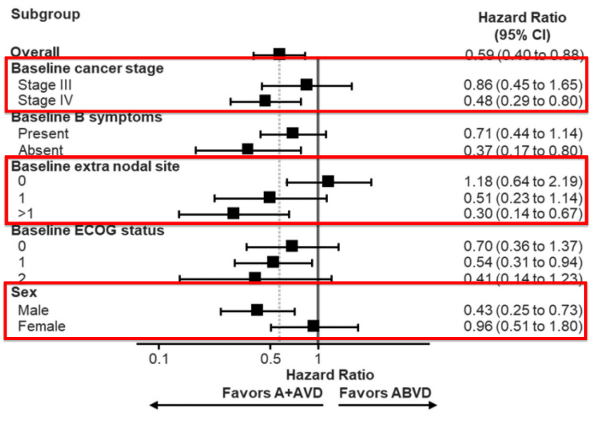
Ansell et al, NEJM 2022

33

ECHELON-1 subgroup analysis

- Greater benefit of BV-AVD with high-risk disease: stage IV, IPS 4-7, extranodal involvement
- Less benefit in older adults >60, female patients, and lower risk disease (IPI 0-1)





Ansell et al, NEJM 2022

34

ECHELON-1 – subsequent lymphoma therapy

- Fewer patients in the BV-AVD arm required subsequent therapy including auto-HCT and allo-HCT

	A+AVD (n=662)	ABVD (n=659)	Total (N=1,321)
Patients with ≥1 subsequent anticancer therapy, n (%)	135 (20)	157 (24)	292 (22)
Type of therapy, n (%)			
Chemotherapy regimens	78 (12)	108 (16)	186 (14)
Brentuximab vedotin monotherapy	8 (1)	49 (7)	57 (4)
Brentuximab vedotin + chemotherapy	2 (<1)	20 (3)	22 (2)
Radiation	54 (8)	54 (8)	108 (8)
Chemotherapy + radiation	1 (<1)	4 (<1)	5 (<1)
High-dose chemotherapy + transplant	44 (7)	59 (9)	103 (8)
Allogeneic transplant	4 (<1)	12 (2)	16 (1)
Immunotherapy*	18 (3)	24 (4)	42 (3)
Brentuximab vedotin + nivolumab	0 (0)	4 (<1)	4 (<1)
Nivolumab	15 (2)	18 (3)	33 (2)
Pembrolizumab	2 (<1)	6 (<1)	8 (<1)
Nivolumab combinations	1 (<1)	1 (<1)	2 (<1)

*Immunotherapy was based predominantly on anti-PD-1 agents.

Ansell et al, NEJM 2022

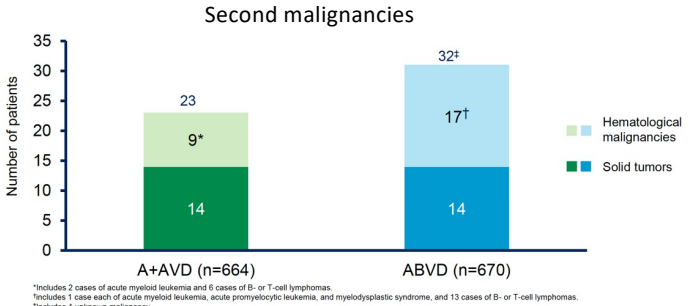
35

ECHELON-1 – Causes of death

- Most deaths were from progressive disease in both cohorts
- Unexpected high rate of deaths from second cancers in the ABVD arm (mostly NHL)

Table 1. Summary of Causes of Death (Safety Population).*

Cause of Death	A+AVD (N=662)	ABVD (N=659)
Any cause — no. (%)	39 (5.9)	64 (9.7)
Hodgkin's lymphoma or complications — no.	32	45
Second cancer — no.	1	11
Other cause — no.	6	8
Unknown cause	1	5†
Accident or suicide	3	0
Covid-19	0	1
Heart failure	1	1
Intracranial hemorrhage	1	0
Lower respiratory tract infection	0	1



*Includes 2 cases of acute myeloid leukemia and 6 cases of B- or T-cell lymphomas.
†Includes 1 case each of acute myeloid leukemia, acute promyelocytic leukemia, and myelodysplastic syndrome, and 13 cases of B- or T-cell lymphomas.
‡Includes 1 unknown malignancy.

Among patients with second malignancies:

- Two patients on each arm received transplant
- Three patients on the ABVD arm received prior radiation (none with A+AVD)

Ansell et al, NEJM 2022

36

Relapsed/refractory HL

- Rebiopsy is critical to confirm relapse or refractory disease
- Salvage therapy and autologous stem cell transplant (ASCT) is the current standard of care
- Achieving a CR by PET prior to ASCT is a key prognostic factor for PFS

Benign thymic hyperplasia mimicking relapse in mediastinum

40

Novel salvage regimens increase CR rate and PFS after ASCT

N = 853 patients

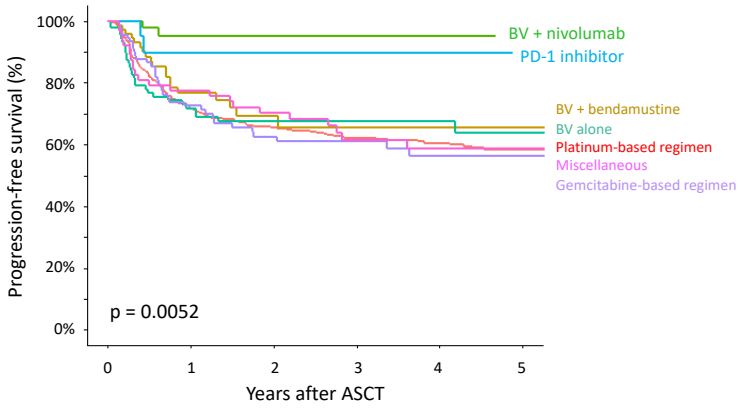
12 U.S. centers

ASCT between 2010-2020

Outcomes compared by salvage regimen:

- Platinum-based regimen (N=451)
- Gemcitabine-based regimen (N=90)
- BV alone (N=87)
- BV + bendamustine (N=76)
- BV + nivolumab (N=48)
- PD-1 inhibitor (N=24)
- Miscellaneous (N=64)

- Higher CR rate with BV+benda (80%) and BV+nivo (67%) vs platinum (49%) (p<0.001)
- Excellent PFS with BV+nivo and PD-1 inhibitors vs platinum regimens (p<0.01)

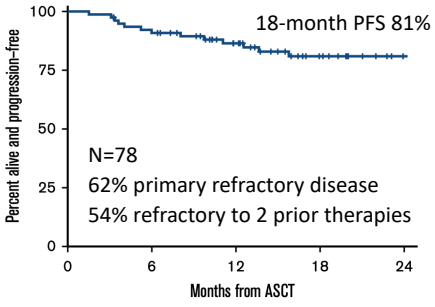


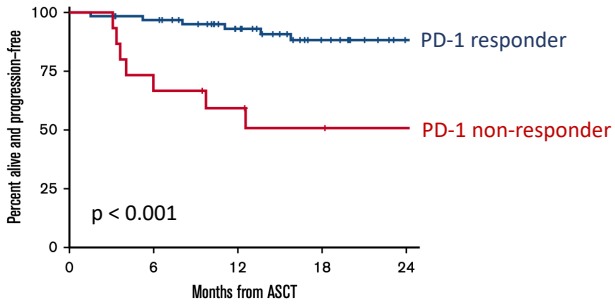
Desai S, Spinner MA, David KA, et al, 2021 ASH Abstract #878

41

ASCT after PD-1 blockade in R/R HL

- Recent studies suggest that PD-1 inhibitors may sensitize HL to subsequent chemotherapy[1,2]
- Chemorefractory patients who respond to PD-1 inhibitors have excellent outcomes after ASCT[3]
- Response to PD-1 blockade better predicts post-transplant PFS than prior chemosensitivity[3]





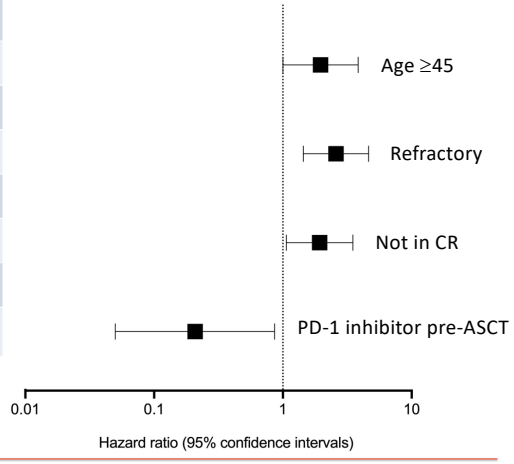
[1]Rossi et al, *Am J Hematol* 2018 [2]Carreau et al, *Oncologist* 2020 [3]Merryman et al, *Blood Adv* 2021

42

PD-1 inhibitors pre-ASCT improve PFS in multivariate analysis

N = 183 patients with R/R cHL transplanted at Stanford from 2011-2020

Variable	N (%)	HR (95% CI)	P value
Age <45	146 (80%)	Reference	
Age ≥45	37 (20%)	**1.961 (1.001-3.841)**	**0.0497**
Relapsed	133 (73%)	Reference	
Refractory	50 (27%)	**2.583 (1.441-4.629)**	**0.00143**
CR	111 (61%)	Reference	
Not in CR	72 (39%)	**1.928 (1.063-3.497)**	**0.0307**
Chemotherapy pre-ASCT	156 (85%)	Reference	
PD-1 inhibitor pre-ASCT	27 (15%)	**0.208 (0.050-0.862)**	**0.0304**

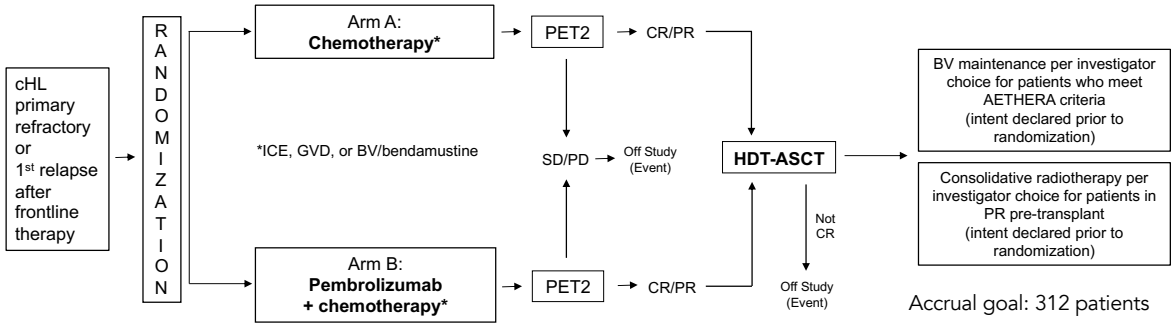


Spinner et al, unpublished data

43

ECOG-ACRIN 4211 trial

- Phase 3 trial comparing SOC chemotherapy vs pembrolizumab + chemotherapy as first salvage for R/R cHL



- Primary endpoint: 2-year PFS
- Secondary endpoints: 2-year OS, CR rate, CR rate after ASCT
- Correlative studies: ctDNA assessments, PB immune cell profiling
- Planning to open at ALLIANCE cooperative group sites including UCSF in 2023

Accrual goal: 312 patients

Stratification factors:

- Frontline therapy received
- Age group (<18 or >/=18)
- Intent to use BV maintenance
- Intent to use RT consolidation

44

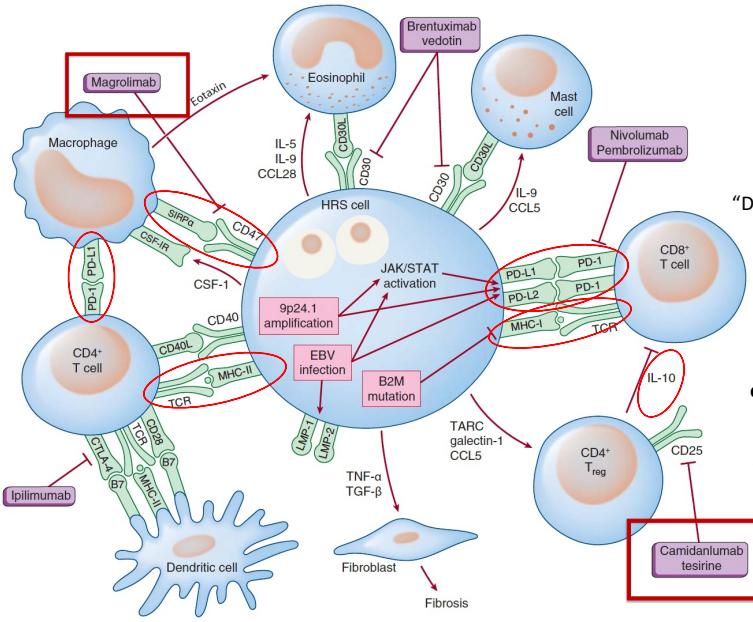
Reed-Sternberg cells evade the immune system through multiple pathways

CD47 overexpression

"Don't eat me" signal

Decreased or absent MHC class I or II expression

Impaired antigen presentation



PD-L1 and PD-L2 overexpression

"Don't find me" signal

Anti-inflammatory cytokine production

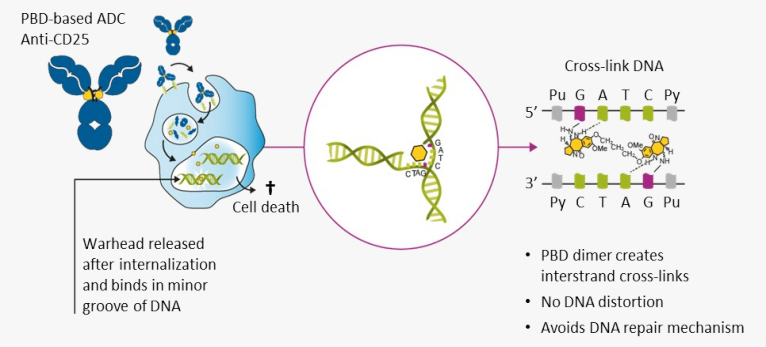
Promoting an immunosuppressive microenvironment

Spinner MA, Mou E, Advani RH. Chapter 96. Hodgkin Lymphoma. Williams Hematology. 2021

45

Depleting immunosuppressive T_{regs} in the tumor microenvironment

- **Camidanlumab tesirine** - anti-CD25 ADC, releases PBD dimer which crosslinks DNA leading to cell death[1]
- Two potential mechanisms of action in Hodgkin lymphoma[2]
  - Death of CD25+ tumor cells (expressed in 60-80% of Reed-Sternberg cells)
  - Depleting immunosuppressive CD25+ regulatory T cells → increased T_{eff}:T_{reg} ratio

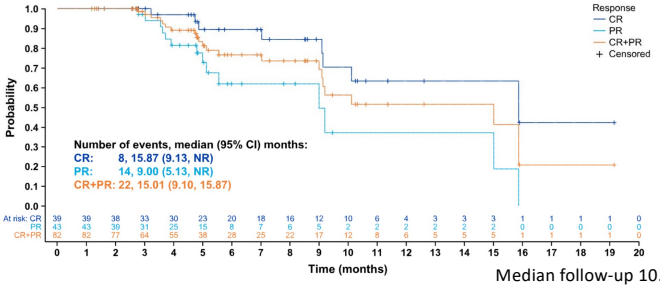


[1]Hartley et al, *Expert Opin Investig Drugs* 2011 [2]Flynn et al, *Mol Cancer Ther* 2016

46

Phase 2 study of camidanlumab tesirine in R/R HL

- Enrolled 117 patients
- Median 5 prior therapies:
  - 100% with prior BV and PD-1 inhibitor
  - 50% with prior autologous HCT
- Dosing schema:
  - Cycle 1-2: 45 mcg/kg IV q3 weeks
  - Cycle 3+: 30 mcg/kg IV q3 weeks
- Activity:
  - **ORR 70%, CR rate 33%**
  - **Median PFS 9.1 months**
  - 14% bridged to auto or allo HCT
- Toxicity profile:
  - **GBS/polyradiculopathy 6.8%**
  - Rash 33%
  - Edema/effusions 17%



Median follow-up 10.7 mo.

Summary of Patients with GBS/polyradiculopathy

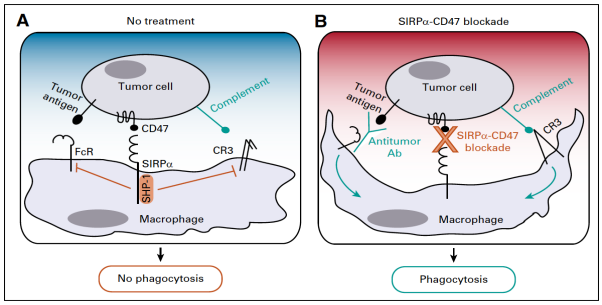
Patient	AE by preferred term	Max grade	Duration (days)	IVIG/PLEX/ Steroids	Outcome at last assessment
1	GBS	4	523	Y/Y/Y	Ongoing at grade 1
2	GBS	4	43	Y/Y/N	Recovered
3	GBS	3	50	Y/Y/Y	Not recovered; patient died of sepsis
4	GBS	3	287	Y/N/Y	Ongoing at grade 1
5	GBS	3	111	Y/Y/Y	Ongoing at grade 1[a]
6	GBS	2	119	Y/N/N	Recovered
7	Polyneuropathy[b], Meningitis, Facial paralysis, SIADH	4	72	Y/N/Y	Recovered
8	Radiculopathy	2	165	Y/Y/Y	Recovered

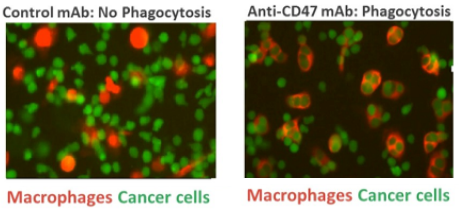
Carlo-Stella et al, 2022 EHA Abstract #S201

47

Activating macrophages in the tumor microenvironment

- CD47 is a "don't eat me" signal overexpressed by many cancers to evade phagocytosis[1]
- **Magrolimab** is an anti-CD47 antibody which promotes phagocytic elimination of multiple lymphoma subtypes in preclinical models[2,3]
- Magrolimab + rituximab was active and well tolerated in multiply R/R B-cell NHL with evidence of synergy, enhancing antibody dependent cellular phagocytosis (ADCP)[4]





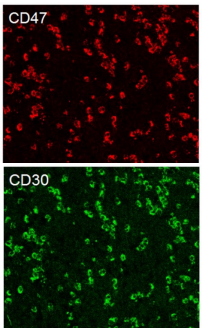
[1]Veillette and Tang, JCO 2019

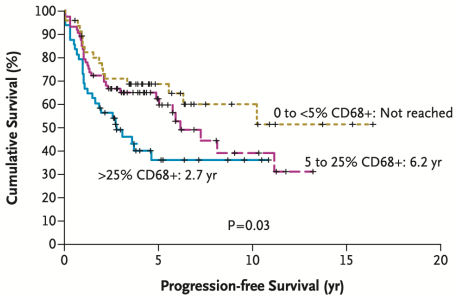
[2]Chao et al, *Cell* 2010
[3]Liu et al, *PLoS One* 2015
[4]Advani et al, NEJM 2018

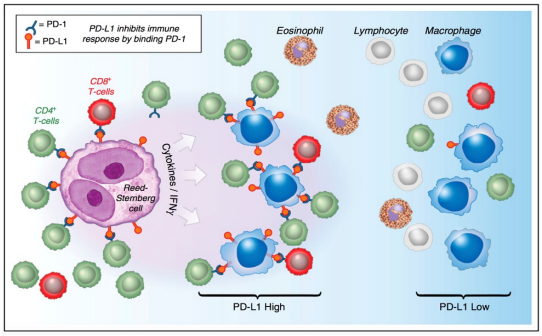
48

Rationale for CD47 blockade and targeting macrophages in HL

- CD47 is consistently overexpressed by Reed-Sternberg cells[1]
- Macrophages are abundant in the HL microenvironment, and an increased number of tumor-associated macrophages is associated with inferior PFS[2,3]
- Topological analysis indicates PD-L1+ macrophages surround Reed-Sternberg cells like a "castle and moat"[4]







[1]Lopez-Pereira et al, *Clin Transl Oncol* 2020 [2]Stiedl et al, NEJM 2010 [3]Tan et al, *Blood* 2012 [4]Carey et al, *Blood* 2017

49

Phase 2 study of magrolimab and pembrolizumab in R/R HL

Eligible patients

Key inclusion criteria
- Adults (age ≥18)
- Biopsy-confirmed R/R cHL
- At least 2 prior lines of therapy

Key exclusion criteria
- Prior Tx with a PD-1 inhibitor within 6 months of enrollment
- Prior allogeneic HCT
- Systemic autoimmune disorder on chronic immunosuppression

REGISTER

Treatment schedule

Cycle 1 (28 days)
Magrolimab 1 mg/kg IV, D1
Magrolimab 30 mg/kg IV, D8, 15, 22
Pembrolizumab 200 mg IV, D8

Cycle 2 (21 days)
Magrolimab 30 mg/kg IV, D1, 8, 15
Pembrolizumab 200 mg IV, D1

Cycle 3 and beyond (21 days)
Magrolimab 45 mg/kg IV, D1
Pembrolizumab 200 mg IV, D1

Progressive disease, unacceptable toxicity, or bridge to SCT, for a maximum treatment period of 24 months

Survival follow up

Currently open at Stanford & DFCI
Accrual goal: 24 patients

- Primary endpoint: **CR rate**
- Secondary endpoints: ORR, DOR, PFS, OS, AEs, immune-related AEs
- Translational correlatives:
  1. Evaluating changes in tumor microenvironment (multiplex immunofluorescence panels of pre-Tx and on-Tx biopsies)
  2. Evaluating potential biomarkers of response (9p24.1 amplification, PD-L1 and CD47 expression, quantitative PET metrics)
  3. Banking serial plasma samples for future correlative studies (ctDNA analysis, single cell RNA sequencing)

50

Hodgkin lymphoma updates - Summary

- With mature 6-year follow-up, BV-AVD improves PFS and OS compared to ABVD in stage III-IV HL
  - Greater benefit in the highest risk patients (stage IV, IPS 4-7, extranodal involvement)
  - Fewer patients receiving BV-AVD required auto or allo HCT
  - Now category 1 recommendation in NCCN guidelines
- Numerous options for first salvage, with many regimens incorporating BV and/or PD-1 inhibitors
  - Excellent PFS with PD-1 inhibitor-based salvage regimens
  - Phase 3 EA4211 trial will compare chemo vs pembro + chemo as first salvage (**opening at UCSF**)
- Many novel immunotherapy approaches are under investigation for multiply R/R HL
  - Camidanlumab tesirine – anti-CD25 ADC to deplete immunosuppressive T_{regs}
  - Magrolimab – anti-CD47 antibody to enhance phagocytosis (**phase 2 trial open at Stanford**)
  - Many others in development (anti-LAG3 antibody, CD30/CD16A bispecific Ab, CD30 CAR-T)

Hematologic Malignancies Updates: Leukemias, Lymphomas, & Myeloma

Myeloma Update 2022

Michaela Liedtke, MD

Stanford University

UPDATES IN MULTIPLE MYELOMA

ANCO 2022

Michaela Liedtke, MD

Illustrations on slides courtesy of respective author and/or Clinical Care Options

Disclosures

- Advisory Board: GSK, Takeda, Kite, Janssen, Natera

Learning Objectives

- Focus on disparities
- Compare 3 or 4 drugs for patients with newly diagnosed myeloma
- Outline approach to relapsed or refractory myeloma
- Review immunotherapies and other novel agents and experimental strategies

Stanford | MEDICINE

3

Disease disparity: Myeloma incidence & characteristics

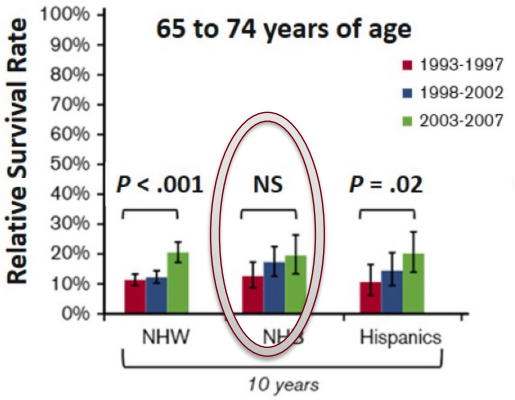
- 2.5-fold higher incidence in black patients
- Family history more common
- Younger age at diagnosis
- Higher rate of comorbidities

- Higher prevalence of myeloma-defining events
- Association with high-risk translocations

Stanford | MEDICINE

4

Outcome disparity



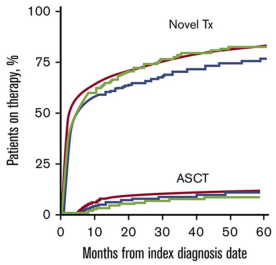
No significant improvement in survival for the Non-Hispanic Black population

Costa L, et al. Blood Advances 2017.

Stanford | MEDICINE

5

Access disparity



Cohort	N	Mean age (y)	Mean CCI
White	3,504	75.8	2.2
AA	858	71.8	3.2
HISP	468	72.7	2.7

Novel Tx	Median (months)	Log-rank *P* value (vs White)
White	2.7	–
AA	5.2	<0.001
HISP	4.6	<0.05

ASCT	Median (months)	Log-rank *P* value (vs White)
White	Not reached	–
AA	Not reached	0.08
HISP	Not reached	<0.05

AA, African American; HISP, Hispanic; CCI, Charlson Comorbidity Index; ASCT, autologous stem cell transplant

	White N = 526	Black N = 113	*P* Value
Induction therapy			0.001
Any triplet	384 (73%)	62 (55%)	<0.001
PI+IMiD triplet	240 (46%)	40 (35%)	0.05
Alkylator-based triplet	144 (27%)	22 (20%)	0.1
Doublet	118 (22%)	46 (41%)	<0.001
Other	24 (5%)	5 (4%)	1

Time to novel therapy is twice as long for African Americans compared to Whites

Triplet regimens are less commonly used for African Americans

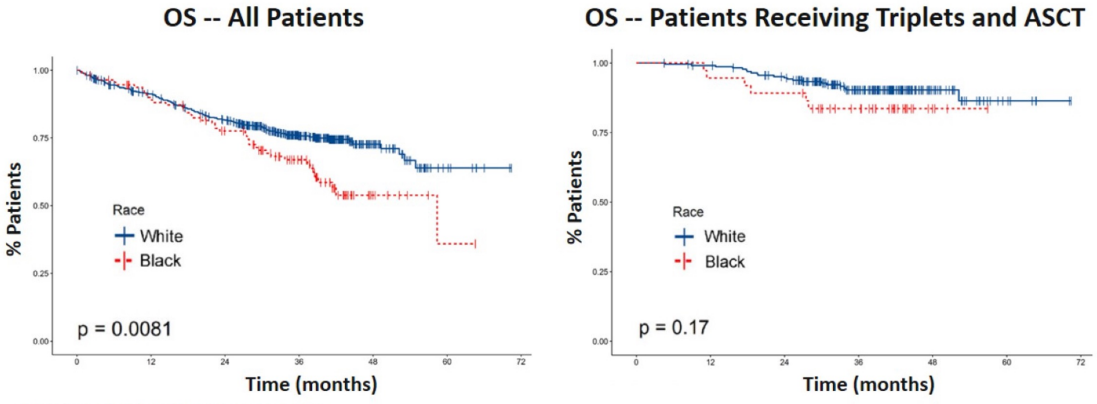
Ailawadhi S, et al. Blood Advances 2019.

Derman BA, et al. Blood Cancer Journal 2020.

Stanford | MEDICINE

6

Equal access results in equal outcome



Derman BA, et al. Blood Cancer Journal 2020.

Stanford | MEDICINE

7

Identify and address disparities

More likely to be affected by poverty

More likely to be uninsured

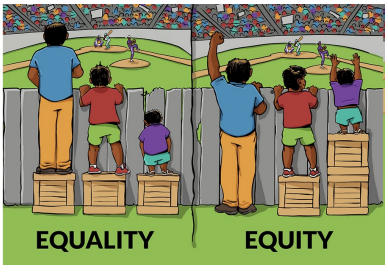
More likely to live in rural areas

Connect patient with resources

Improve understanding of disease

Be sensitive to cultural differences

Adhere to standards



Adapted from 'Interaction Institute for Social Change; Artist: Angus Maguire

Stanford | MEDICINE

8

Summary

- Racial disparities are evident in myeloma across a wide spectrum
- Outcome disparities can be overcome by equal access to care
- Awareness and mitigation strategies are needed to identify and address racial disparities

Stanford | MEDICINE

9

Newly diagnosed myeloma: Goals of therapy

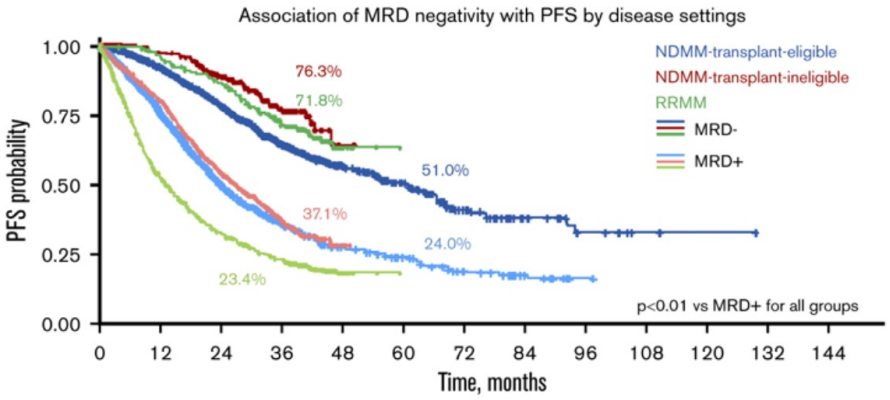
01	02	03	04
Reduce disease burden	Prevent or reverse myeloma-related end organ damage	Manage symptoms of myeloma and myeloma-treatment	Achieve and prolong disease control

Maximize progression free and overall survival with best possible QOL

Stanford | MEDICINE

10

Minimal residual disease



MRD-negativity is associated with longer PFS

Munshi N, et al. Blood Advances 2020.

Stanford | MEDICINE

11

Traditional standard: RVd in IFM/DFCI 2009

NEWLY DIAGNOSED MYELOMA
ASCT-ELIGIBLE UP TO 65 YO

RVD X8
(N = 350)

RVD X3
ASCT
RVDX2
(N = 350)

LENALIDOMIDE
X12 MO

LENALIDOMIDE
X12 MO

Outcome	ARM A (n = 350)	ARM B (n = 350)	HR (95% CI), *P* Value
CR, %	49	59	0.02
MRD - by FCM, %	65	80	0.001
4-yr OS, %	83	81	1.2 (0.7-1.8), NS
4-yr PFS, %	35	47	0.69 (0.56-0.84), < .001

Upfront ASCT improves median PFS from 36 to 50 months

After 8 years of follow-up over 60% of patients are alive in both arms

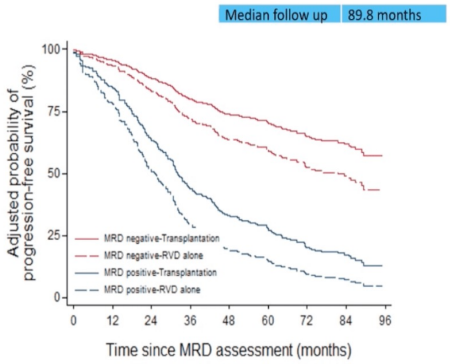
Attal M, et al. NEJM 2017.

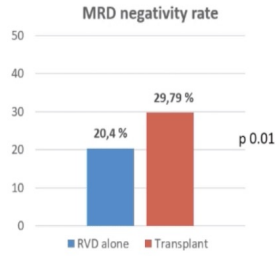
Stanford | MEDICINE

12

IFM/DFCI 2009: Role of MRD

Subgroup analyses





MRD-negativity is a strong predictor for PFS and OS

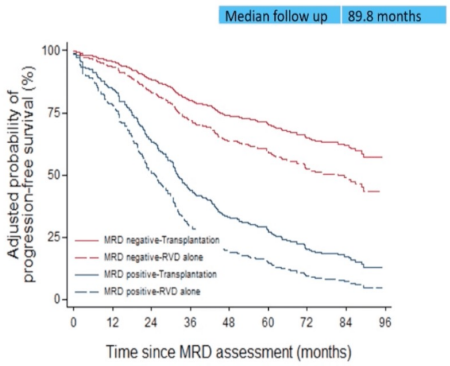
Perrot A, et al. ASH 2020. Abstract 143.

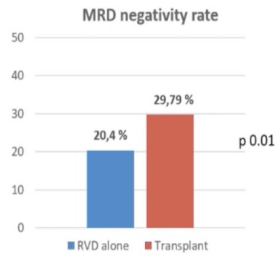
Stanford | MEDICINE

13

IFM/DFCI 2009: Role of MRD

Subgroup analyses





Can we improve these results?

Perrot A, et al. ASH 2020. Abstract 143.

14

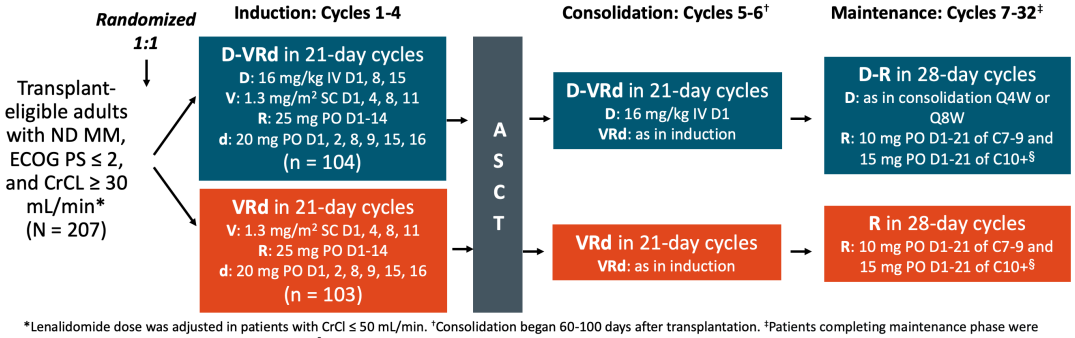
Quadruplet therapies in upfront myeloma

01	02	03	04	05
CASSIOPEIA	GRIFFIN	MASTER	GMMG-HD7	DREAMM-9
Dara + VTd	Dara + VRd	Dara + KRd	Isa + VRd	Belamaf + VRd

Stanford | MEDICINE

15

GRIFFIN: Dara-VRd versus VRd



*Lenalidomide dose was adjusted in patients with CrCl ≤ 50 mL/min. †Consolidation began 60-100 days after transplantation. ‡Patients completing maintenance phase were permitted to continue single-agent lenalidomide. §15 mg administered only if tolerable.

Primary endpoint analysis: addition of D to VRd increased sCR by the end of consolidation, 42.4% vs 32.0% (1-sided *P* = .068)

Laubach, et al. ASH 2021. Abstract 79.

Slide credit: clinicaloptions.com

Stanford | MEDICINE

16

GRIFFIN: Responses deepen over time

Depth of Response	D-VRd				VRd			
	End of Induction	End of ASCT	End of Consolidation	24 Mos of Maintenance Cutoff	End of Induction	End of ASCT	End of Consolidation	24 Mos of Maintenance Cutoff
sCR	12	21	42	66	7	14	32	47
CR	7	6	9.	16	6	5	10	13
VGPR	53	60	39	14	43	46	31	18
PR	26	12	8	3	35	26	19	14
SD/PD/NE	2	1	1	1	8	8	8	7

After 2 years of maintenance, sCR rate still higher in Dara-VRd

Laubach J, et al. ASH 2021. Abstract 79.

Stanford | MEDICINE

17

GRIFFIN: High MRD-negativity rates

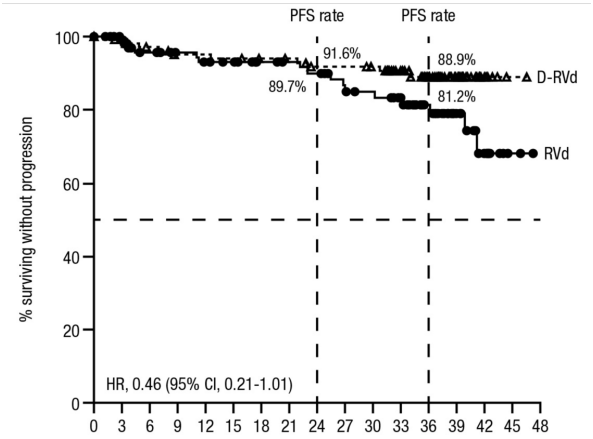
MRD status	D-VRd	VRd
ITT MRD-negative	64.4%	30.1%
CR or better and MRD-negative	78%	47.5%
36 mo PFS ITT all pts	88.9%	81.2%

Laubach J, et al. ASH 2021. Abstract 79.

Stanford | MEDICINE

18

GRIFFIN: D-RVd prolongs PFS



Median PFS/OS not reached in either arm at median follow-up of 38.6 mos

Laubach J, et al. ASH 2021. Abstract 79.

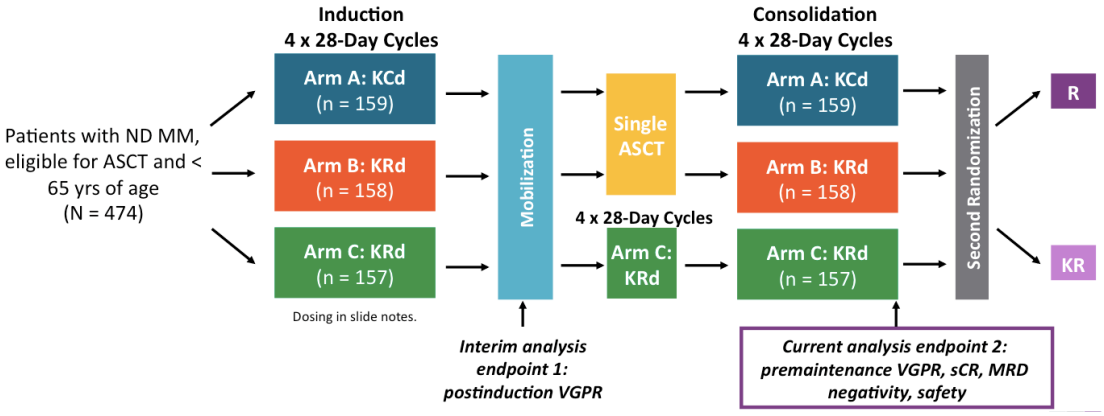
19

FORTE: KRd +/- ASCT

- Multicenter, randomized, open-label phase II study



Gay F, et al. Lancet Oncology 2021.

Slide credit: clinicaloptions.com

Stanford | MEDICINE

20

FORTE: Initial randomization

Outcome	KCd-ASCT	KRd12	KRd-ASCT
At least CR, %	42	57	54
MRD – 10^{-5}, % (ITT)	43	56	62
4-yr PFS, %	51	56	**69**
Median PFS	53 mo	55.3 mo	Not reached
3-yr OS%	83	90	90

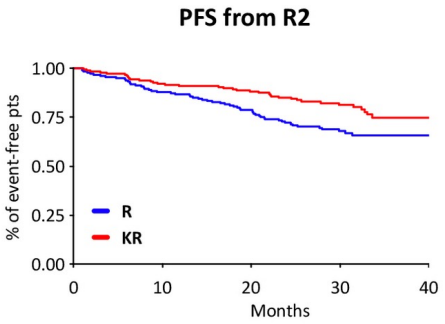
KRd-ASCT increased rate of MRD-negativity and 4-yr PFS

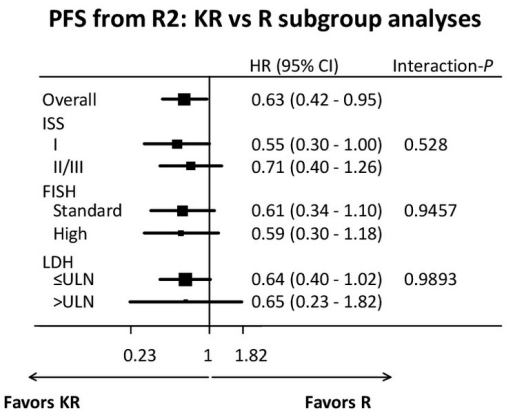
Gay F, et al. Lancet Oncology 2021.

Stanford | MEDICINE

21

FORTE: Second randomization





KR maintenance increased PFS compared to lenalidomide alone

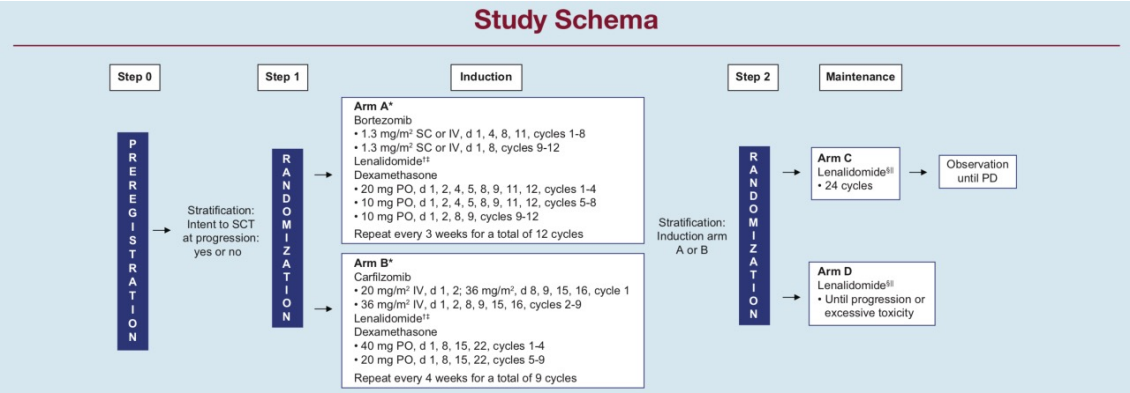
Gay F, et al. ASH 2020. Abstract 141.

Stanford | MEDICINE

22

ENDURANCE: KRd versus VRd

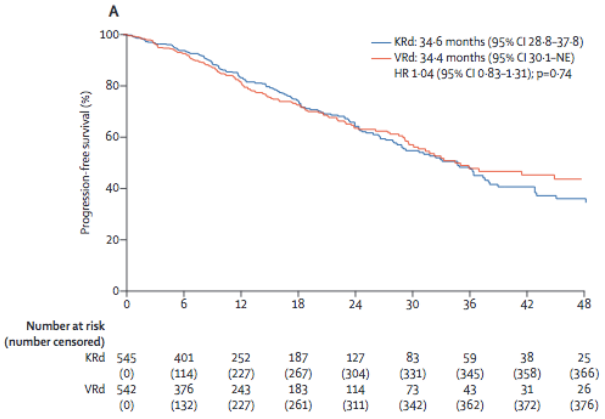
Study enrolled >1,000 patients with standard risk myeloma not planned for ASCT



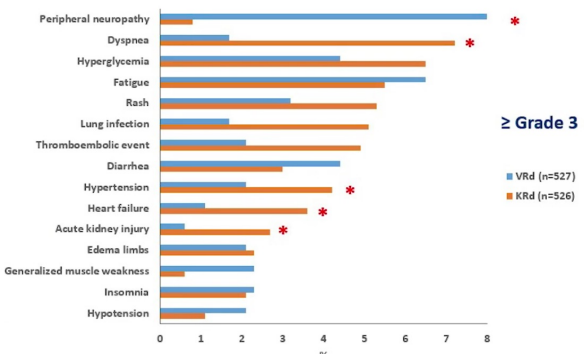
KRd was associated with deeper responses: VGPR or better 74% vs 65%

23

KRd did not improve PFS compared to VRd



Subgroup analysis did not identify benefit based on age or disease characteristics



Rate of cardio-pulmonary and renal toxicity is higher with carfilzomib

Kumar S, et al. Lancet Oncology 2020.

24

KarMMa-4: upfront CAR-T for high-risk myeloma

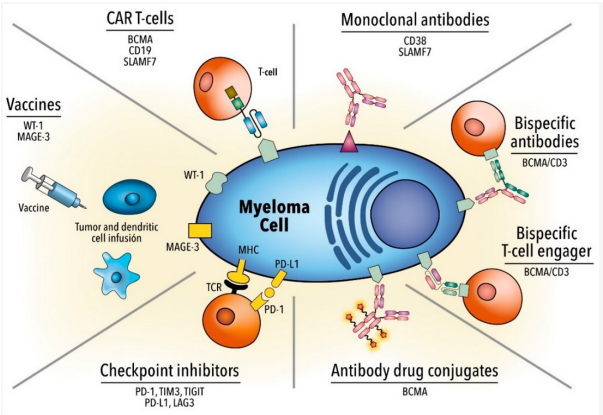
33

Focus on Immunotherapy

- Naked antibodies
- **Antibody-drug conjugates**
- **Bispecific/T-cell engager**
- **CAR T-cells**



Rodriguez-Lobato L, et al. ASH 2021.

Stanford MEDICINE

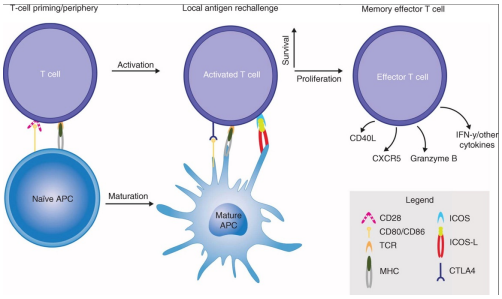
34

Antibody drug conjugate: belantamab mafodotin plus ICOS-agonist feladilimab

Belantamab mafodotin is an ADC targeting BCMA

ICOS (inducible co-stimulator) is a co-stimulatory receptor of CD28 superfamily on T-cells
Feladilimab is an ICOS agonist that promotes T-cell anti-tumor activity

Intravenous infusion q3weeks
Eye exam prior to every infusion



Efficacy	N=23
ORR	48%
PR	22%
VGPR	17%
CR	8%

MyDRUG: Myeloma-Developing Regimens Using Genomics

6-arm, nonrandomized phase I/II study

Patients with RR MM after 1-3 prior therapies including a PI and an IMiD; in early relapse*; 30% mutation in *CDKN2C, FGFR3, KRAS, NRAS, BRAF V600E, IDH2* or t(11;14)
(Planned N = 228)
*within 3 yrs of ASCT on maintenance or 18 months if no maintenance, or within 18 months of initial non-ASCT-based therapy

- Primary endpoint: ORR with actionable genetic alteration
- Secondary endpoint: ORR with nonactionable genetic alteration

All patients received ixazomib/ pomalidomide/dexamethasone, plus:

- *CDK2* alteration: Abemaciclib (Planned n = 38)
- *IDH2* mutation: Enasidenib (Planned n = 38)
- *RAF/RAS* mutation: Cobimetinib (Planned n = 38)
- *FGFR3* mutation: Erdafitinib (Planned n = 38)
- t(11;14): Venetoclax (Planned n = 38)
- "Nonactionable genetic abnormality": Daratumumab (Planned n = 38)

ClinicalTrials.gov. NCT03732703.

Stanford MEDICINE

45

Summary

- Immunotherapy is taking center stage in myeloma
- CAR T cells and Bispecifics are highly active and share side effect profile of CRS and neurotoxicity
- Agents with novel mechanisms of action are being developed
- Precision Medicine is used to target defined genetic Multiple Myeloma subsets
- Response & Survival rates are improving due to new treatment approaches

Hematologic Malignancies Update 2022: Cases

Tamer Othman, MD

1

Case 1

- HPI abridged
  - 61 yo M with a PMH of HTN who presented with a 2-month history of progressive cough, fatigue, dizziness, SOB, 35 lbs unintentional wt loss, and bruising
  - No prior history of malignancies or hematologic disorders
  - ECOG 0
  - Notable physical exam findings
    - Subconjunctival pallor, palatal petechiae
  - Pertinent labs/imaging
    - CBC: WBC 2.3 (ANC 300), Hgb 3.3, MCV 102.7, plts 40
    - Peripheral smear shows 2% blasts. No auer rods visualized.
    - Chemistry: Cr + AST/ALT/AP WNL, Tbili 1.9, K 4.4, Ca 8.7 phos 6.4, uric acid 9.3, LDH 981
    - Coags WNL
    - CXR and TTE without any abnormalities, EF=63%

2

Case 1

- Bone marrow biopsy (aspirate smear and core)
  - Normocellular (45%) with 12% blasts
  - No dysplastic lineages on morphologic assessment
- Flow cytometry on BM
  - Immunophenotyping shows CD33+
- Cytogenetics
  - 46,XY
- Next-gen sequencing
  - NPM1 mutated

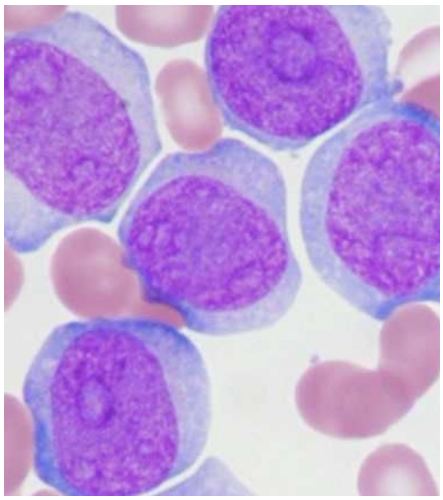

Image credit: https://www.pinterest.co.kr/pin/687784174316025612/

3

Case 1

- Question for the audience:
  - How would you manage this patient?
    - A. Hypomethylating agent
    - B. Supportive care
    - C. 7+3+/- GO
    - D. Clinical trial for MDS-IB1 (formerly MDS-EB1)
    - E. Hypomethylating agent + venetoclax

4

Case 1

- In oncology, a clinical trial is always strongly recommended when available and the patient is eligible
- However in this case, the patient meets the diagnostic criteria of AML, not MDS
- In the 4th edition of WHO myeloid neoplasms and acute leukemia classification, the presence of certain cytogenetic/FISH findings were diagnostic of AML irrespective of the blast %:
  - t(8;21)(q22;q22.1);RUNX1-RUNX1T1
  - inv(16)(p13.1q22) or t(16;16)(p13.1;q22);CBFB-MYH11
  - APL with PML-RARA

In the 5th edition

Table 7. Acute myeloid leukaemia.

Acute myeloid leukaemia with defining genetic abnormalities
Acute promyelocytic leukaemia with *PML::RARA* fusion
Acute myeloid leukaemia with *RUNX1::RUNX1T1* fusion
Acute myeloid leukaemia with *CBFB::MYH11* fusion
Acute myeloid leukaemia with *DEK::NUP214* fusion
Acute myeloid leukaemia with *RBM15::MRTFA* fusion
Acute myeloid leukaemia with *BCR::ABL1* fusion
Acute myeloid leukaemia with *KMT2A* rearrangement
Acute myeloid leukaemia with *MECOM* rearrangement
Acute myeloid leukaemia with *NUP98* rearrangement
Acute myeloid leukaemia with *NPM1* mutation
Acute myeloid leukaemia with *CEBPA* mutation
Acute myeloid leukaemia, myelodysplasia-related
Acute myeloid leukaemia with other defined genetic alterations
Acute myeloid leukaemia, defined by differentiation
Acute myeloid leukaemia with minimal differentiation
Acute myeloid leukaemia without maturation
Acute myeloid leukaemia with maturation
Acute basophilic leukaemia
Acute myelomonocytic leukaemia
Acute monocytic leukaemia
Acute erythroid leukaemia
Acute megakaryoblastic leukaemia

Most AML with defining genetic abnormalities may be diagnosed with <20% blasts

Khoury, Leukemia 2022

5

Case 1

- International Consensus Criteria

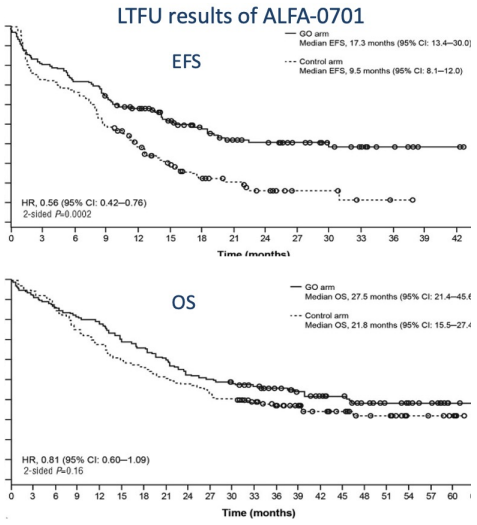
Table 26. Classification of acute myeloid leukemia (AML) with percentage of blasts required for diagnosis

- **Acute promyelocytic leukemia (APL) with t(15;17)(q24.1;q21.2)/*PML*::*RARA*** ≥10%
- **APL with other *RARA* rearrangements*** ≥10%
- **AML with t(8;21)(q22;q22.1)/*RUNX1*::*RUNX1T1*** ≥10%
- **AML with inv(16)(p13.1q22) or t(16;16)(p13.1;q22)/*CBFB*::*MYH11*** ≥10%
- **AML with t(9;11)(p21.3;q23.3)/*MLLT3*::*KMT2A*** ≥10%
- **AML with other *KMT2A* rearrangements**** ≥10%
- **AML with t(6;9)(p22.3;q34.1)/*DEK*::*NUP214*** ≥10%
- **AML with inv(3)(q21.3q26.2) or t(3;3)(q21.3;q26.2)/*GATA2*; *MECOM*(*EVI1*)** ≥10%
- **AML with other *MECOM* rearrangements***** ≥10%
- **AML with other rare recurring translocations (see Supplemental Table 5)** ≥10%
- **AML with t(9;22)(q34.1;q11.2)/*BCR*::*ABL1*‡** ≥20%
- **AML with mutated *NPM1*** ≥10%
- **AML with in-frame bZIP *CEBPA* mutations** ≥10%
- **AML and MDS/AML with mutated *TP53*†** 10-19% (MDS/AML) and ≥20% (AML)
- **AML and MDS/AML with myelodysplasia-related gene mutations** 10-19% (MDS/AML) and ≥20% (AML)
  - Defined by mutations in *ASXL1*, *BCOR*, *EZH2*, *RUNX1*, *SF3B1*, *SRSF2*, *STAG2*, *U2AF1*, or *ZRSR2*
- **AML with myelodysplasia-related cytogenetic abnormalities** 10-19% (MDS/AML) and ≥20% (AML)
  - Defined by detecting a complex karyotype (≥3 unrelated clonal chromosomal abnormalities in the absence of other class-defining recurring genetic abnormalities), del(5q)/t(5q)/add(5q), -7/del(7q), +8, del(12p)/t(12p)/add(12p), i(17q), -17/add(17p) or del(17p), del(20q), and/or idic(X)(q13) clonal abnormalities
- **AML not otherwise specified (NOS)** 10-19% (MDS/AML) and ≥20% (AML)
- **Myeloid Sarcoma**

6

Case 1

- Should GO be added?
  - GO is a CD33-targeting ADC
  - Several trials tested chemo + GO
  - ALFA-0701 trial specifically studied 7+3+GO
    - Initial results showed OS and EFS benefit
    - OS benefit lost in LTFU report
  - 4 meta-analyses were conducted
    - Loke et al
      - ↑ induction deaths but ↓ resistant disease
      - ↑ RFS but no OS benefit
        - » ↑ OS in pts with favorable cytogenetics only
    - Kharfan-Dabaja et al
      - ↑ RFS but also early mortality, no OS benefit
        - » ↑ RFS in favorable/intermediate cytogenetics
    - Li et al
      - ↑ RFS and OS, ↓ resistant disease and relapse
        - » OS benefit only in favorable
    - Hills et al
      - ↓ relapse and ↑ OS
        - » OS benefit in those with favorable/intermediate cytogenetics



Castaigne et al, Lancet 2012; Lambert et al, Haematologica 2019; Hills et al, Lancet Oncol 2014; Li, Ann Oncol 2014; Loke, Ann Hematol 2015; Kharfa-Dabaja, BJH 2013

7

Case 1

- Intensive chemotherapy or low-intensity therapy?
  - Balance chance of disease control and risk of major morbidity/early mortality
  - Intensive induction for pts <60 with favorable/intermediate-risk
  - For pts <60 with unfavorable-risk AML, alternative induction strategies should be considered
    - Clinical trial
    - HMA-Ven
    - 10 days of decitabine
  - For ≥60, factor to consider
    - Organ function
    - Performance status
    - AML risk stratification
  - Pts ineligible for intensive chemo are more appropriate for HMA/Ven or targeted therapy
    - Rapid screening for actionable mutations should also be performed (i.e., FLT3, IDH1/2)

8

Case 1

- GO is recommended in favorable- or intermediate-risk CD33+ AML
- Data suggests benefit in NPM1 mutated AML specifically
  - AMLSG 09-09 trial:
    - GO + intensive chemotherapy in NPM1 mutated AML = ↓NPM1 transcripts by RT-qPCR (MRD) and cumulative incidence of relapse
- No benefit in adverse-risk AML

ELN 2022 risk stratification

Genetic Abnormality

- t(8;21)(q22;q22.1)/*RUNX1::RUNX1T1*[b,c]
- inv(16)(p13.1q22) or t(16;16)(p13.1;q22)/*CBFB::MYH11*[b,c]
- Mutated *NPM1*[b,d] without *FLT3*-ITD
- bZIP in-frame mutated *CEBPA*[e]

- Mutated *NPM1*[b,d] with *FLT3*-ITD
- Wild-type *NPM1* with *FLT3*-ITD
- t(9;11)(p21.3;q23.3)/*MLLT3::KMT2A*[b,f]
- Cytogenetic and/or molecular abnormalities not classified as favor

- t(6;9)(p23;q34.1)/*DEK::NUP214*
- t(v;11q23.3)/*KMT2A*-rearranged[g]
- t(9;22)(q34.1;q11.2)/*BCR::ABL1*
- t(8;16)(p11;p13)/*KAT6A::CREBBP*
- inv(3)(q21.3q26.2) or t(3;3)(q21.3;q26.2)/*GATA2, MECOM(EVI1)*
- t(3q26.2;v)/*MECOM(EVI1)*-rearranged
- -5 or del(5q); -7; -17/abn(17p)
- Complex karyotype,[h] monosomal karyotype[i]
- Mutated *ASXL1, BCOR, EZH2, RUNX1, SF3B1, SRSF2, STAG2,*
- Mutated *TP53*[k]

Dohner, Blood 2022

9

Case 1

- Induction course
  - Pt is started on 7+3+GO
  - C/b LLL pneumonia, strep bacteremia, febrile neutropenia, and sepsis
  - D14 BMBx – 5% cellularity and 1% blasts
  - D28 BMBx – CR: 90% cellularity and 3% blasts with ANC >1000 and plts >100
    - Cytogenetics 46,XY, FISH negative
    - Multicolor flow cytometry (MFC) MRD negative
    - NPM1 real time quantitative polymerase chain reaction (RQ-PCR) negative

10

Case 1

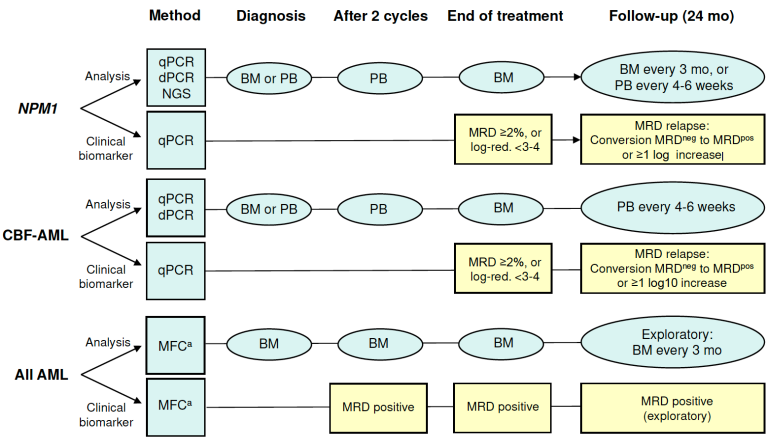
- Role of MRD in AML
  - Still under investigation
  - Assessed with MFC and RQ-PCR
  - Mutations seen in CHIP and with aging (DNMT3A, TET2, ?ASXL1) are not reliable MRD markers
    - Preleukemic mutation detection at CR does not signify residual disease
    - NPM1 mutations, CBFB-MYH11, RUNX1-RUNX1T1, KMT2A-MLLT3, DEK-NUP214, BCR-ABL1 gene fusions, and WT1 expression.
  - Persistently MRD+ is associated with increased risk of morphologic relapse
  - Detectable NPM1 by RQ-PCR and +MRD MFC also correlates with ↓OS
  - MRD status at alloHCT (if indicated)
    - MRD- associated with ↓ relapse and ↑OS
    - Unclear if pre-alloHCT chemo consolidation to achieve MRD- improves outcomes
      - » Equal outcomes post-alloHCT regardless of timing of MRD- CR pre-alloHCT
      - » A small % of pts MRD+ post-induction convert to MRD- with consolidative chemo
      - » Delaying alloHCT to achieve MRD- may lead to morphologic relapse

Morita, J Clin Oncol, 2018; Araki J Clin Oncol, 2016; Lane, Leuk Lymphoma, 2008; Walter, Blood, 2013; Buccisano, Leukemia, 2006; Dohner, Blood 2022

11

Case 1

Figure 2. Algorithm of MRD assessment and time points at which MRD is considered a clinically relevant biomarker



Dohner et al, 2022

12

Case 1

- Question for the audience
  - The patient presents to clinic post-consolidation still feeling weak (ECOG 2) with low appetite. How would next manage this patient?
    - A. Consolidation with ara-C + GO
    - B. Referral for alloHCT in CR1
    - C. Both A and B
    - D. Oral azacitidine maintenance

13

Case 1

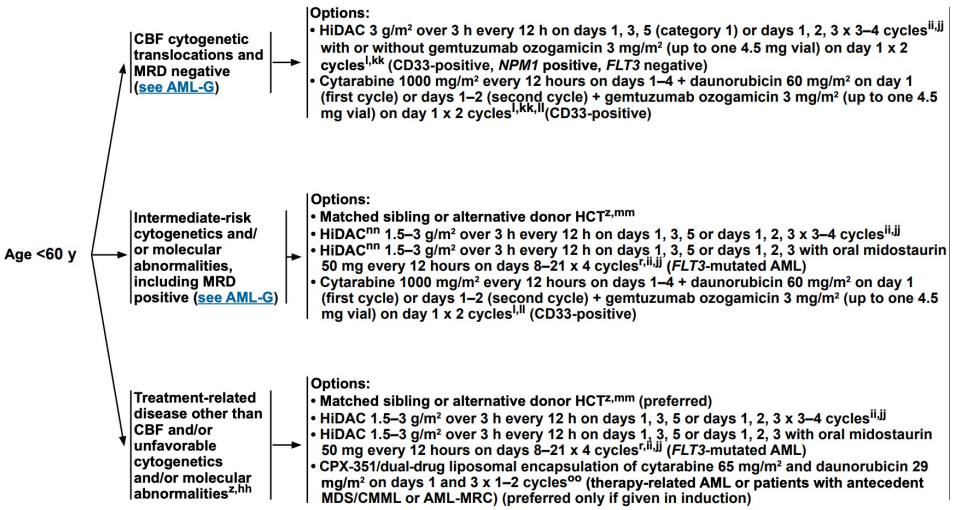
Younger patients (18-60/65 y)	
▪ Favorable-risk genetics	▪ 2-4 cycles of IDAC (1000-1500 mg/m^2 IV over 3 h q12h, d1-3; or 1000-1500 mg/m^2 IV over 3 h d1-5 or 6)
▪ Intermediate-risk genetics	▪ Allogeneic HCT from matched-related or unrelated donor
	▪ 2-4 cycles of IDAC (1000-1500 mg/m^2 IV over 3 h q12h, d1-3; or 1000-1500 mg/m^2 IV over 3 h d1-5 or 6), or
	▪ High-dose therapy and autologous HCT
▪ Adverse-risk genetics	▪ Allogeneic HCT from matched-related or unrelated donor
Older patients (>60/65 y)	
▪ Favorable-risk genetics	▪ 2-3 cycles of IDAC (500-1000 mg/m^2 IV over 3 h q12h, d1-3; or 500-1000 mg/m^2 IV over 3 h d1-5 or 6)
▪ Intermediate/adverse-risk genetics	▪ No established value of intensive consolidation therapy; consider allogeneic HCT in patients with low HCT-Comorbidity Index, or investigational therapy

Generally, patients with favorable-risk AML are not transplanted in CR1, unless there is persistent MRD

Dohner, Blood 2017

14

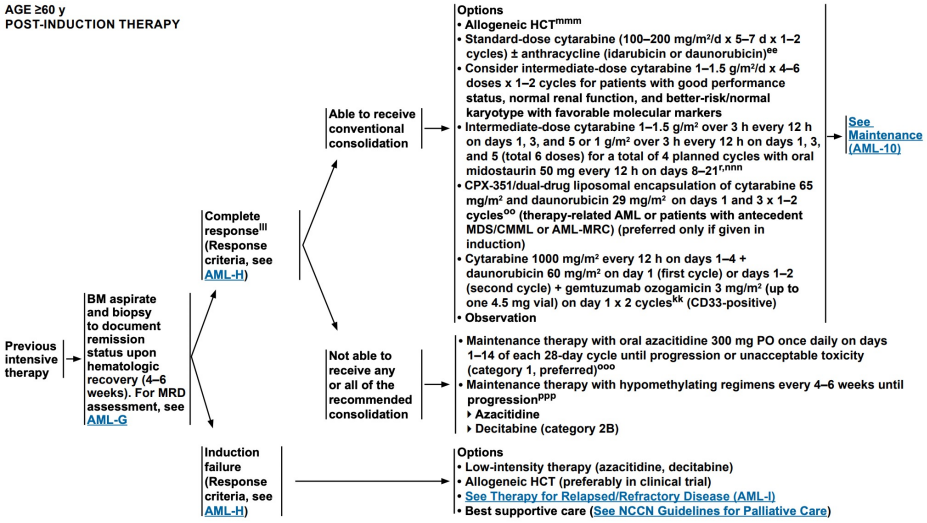
Case 1



NCCN guidelines

15

Case 1

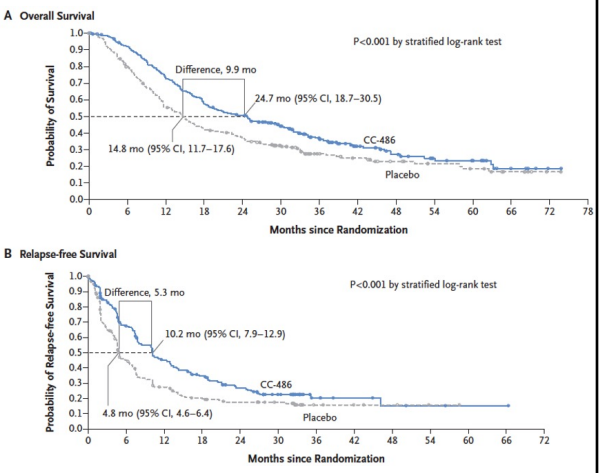


NCCN guidelines

16

Case 1

- Maintenance post-induction in AML without a FLT3 mutation
  - Oral azacitidine (CC-486) in the QUAZAR trial ↓relapse risk and ↑mOS (14.8 vs 24.7 months) independent of MRD-status by MFC among pts ≥55 years ineligible for alloHCT
  - Approved for continued treatment of pts with AML in first CR/CRi following intensive induction chemotherapy who are unable to complete intensive curative therapy
  - Limitations to the trial design prohibit generalizability of the data:
    - Data regarding the role of oral aza in younger pts or those with CBF-AML are lacking;
    - Only few patients had AML with adverse-risk cytogenetics (14%).
    - The trial did not specify prior induction and consolidation therapy, thus, there was a variability in prior therapy in those selected for maintenance
      - 45% of patients had received 1 consolidation cycle, 31% 2 cycles, and 20% no consolidation



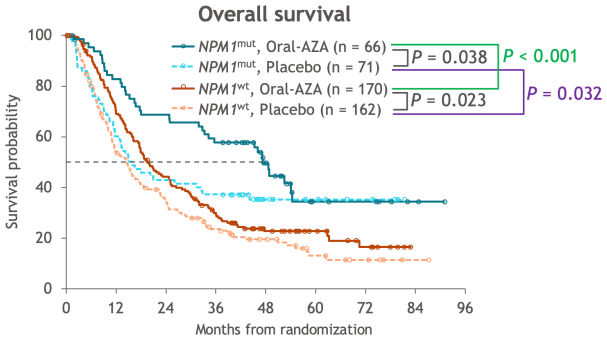
Wei, NEJM 2020; Dohner, Blood 2022

17

Case 1

- QUAZAR AML-001 Trial: post-hoc analysis on effects on NPM1 mutations

NPM1 mutational status at AML Dx was prognostic for OS and RFS, and predictive of a survival benefit for pts treated with Oral-AZA (vs. PBO).



Median OS, months

*NPM1*mut, Oral-AZA	47.2	*NPM1*wt, Oral-AZA	19.6
*NPM1*mut, Placebo	15.9	*NPM1*wt, Placebo	14.6

Döhner et al, EHA 2021. Abstr S131.

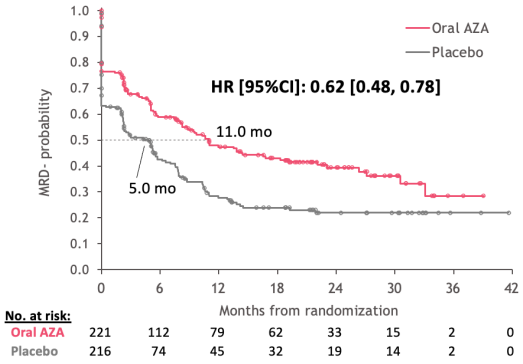
18

Case 1

- Oral AZA was associated with a higher rate of MRD response (BL MRD+, became MRD- on-study) vs. PBO: 37% vs. 19%, respectively

MRD Response	Oral AZA	Placebo
MRD+ at screening, n	**103**	**116**
MRD responders, n/N (%)	**38/103 (37%)**	**22/116 (19%)**
Time to MRD response,[a] n/N (%)		
> 3 to ≤ 6 months	7/38 (18%)	6/22 (27%)
> 6 months	9/38 (24%)	1/22 (5%)

- The median duration of MRD negativity overall (BL MRD– and MRD responders) was extended with Oral AZA vs. PBO



[a]Time from MRD assessment at screening.
95%CI, 95% confidence interval; AZA, azacitidine; BL, baseline; HR, hazard ratio; mo, months; MRD, measurable residual disease; PBO, placebo.

Roboz et al, ASH 2020 Abstract #692

19

Case 1

- The patient is started oral azacitidine maintenance due to his performance status
- NPM1 positive after 1 cycle of oral azacitidine by qPCR on PB, with a new thrombocytopenia noted at this time
- Repeat BMBx showed 26-28% blasts by IHC, aspirate count, and flow, consistent with relapsed AML
- He is started on decitabine/venetoclax

20

Case 1

- HMA/Ven in r/r AML
  - Retrospective data shows ORR 21-64%, mOS 3.4-8 mos
  - One non-randomized phase 2 clinical trial showed an ORR 62%, mOS 7.8 mos

Tenold et al, Front Oncol 2021; Aldoss et al, Haematologica 2018, DiNardo et al, Lancet haematol 2020

21

Case 1

- After 1 cycle, patient achieves CR
  - BMBx shows normocellular marrow (30-40%) with 2% blasts by aspirate count
  - RQ-PCR NPM1 undetectable, MRD MFC negative
  - He undergoes alloHCT in CR2 and remains disease-free 1-year post-transplant

22

Case 1 Summary

- Not all AML requires 20% blasts and careful attention to molecular assays is needed to inform diagnosis and management
- If CD33+ with favorable- or intermediate-risk cytogenetics, add GO to intensive chemo
- AlloHCT is not required in favorable-risk AML in CR1, but is for poor-risk, select cases of intermediate-risk, and r/r AML if eligible
- Oral azacitidine may have a role as maintenance post-induction in patients with intermediate/poor-risk AML achieving CR/CRi and are ineligible for curative alloHCT
- HMA/Ven has efficacy in the r/r setting

23

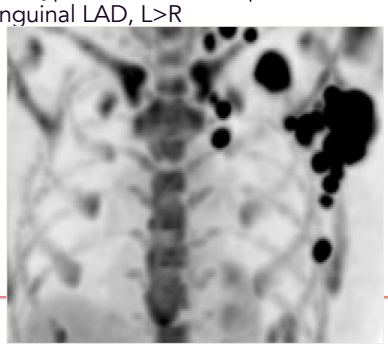
Case 2

- HPI abridged
  - 61 yo M with no prior PMH
  - P/w enlarging L axillary mass over past 3 mos
  - No fevers, night sweats, unintentional weight loss
  - ECOG 0
- Pertinent physical exam findings
  - B/l cervical, supraclavicular, and L axillary LAD appreciated
  - No tenderness to palpation

24

Case 2

- Pertinent labs
  - CBC, CMP WNL, LDH 342
- PET/CT
  - B/l multi-level hypermetabolic cervical + supraclavicular LAD
  - **L axillary bulky LAD 11.5 x 7.5 cm, SUV 29.7 (Deauville 5)**
  - B/l hypermetabolic retroperitoneal, iliac, and inguinal LAD, L>R



- Pathology
  - Excisional biopsy of L axillary mass showed DLBCL, non-GCB subtype
    - IHC with MYC 20% and BCL2 70%
    - EBER ISH negative
    - FISH with BCL6 rearrangement but no MYC or BCL2 rearrangements
  - Bone marrow biopsy negative for lymphoma involvement
- Diagnosis and prognostication
  - Diffuse large B-cell lymphoma, non-GCB, non-DE/DHL
  - Stage III, R-IPI score 3

25

Case 2

- He is started on R-CHOP
- Interim PET scan after 2 cycles showed PR (Deauville 4) with size reduction in all lymph nodes, L axillary mass SUVmax=6, 1 cm
- After C4, reports increasing L axillary swelling and night sweats
- LDH 390
- PET scan after C4 shows PD, L axillary mass SUVmax=35 and now 3 cm, only other site of disease is L sub-pectoral major mass, measuring 2.5 cm, SUV=26

26

Case 2

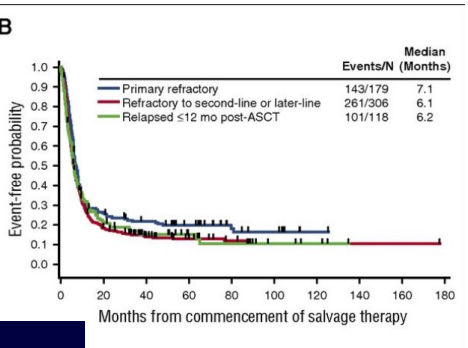
- Question for the audience
  - Which of the following would be the next best step of management?
    - A. Platinum-based salvage therapy followed by CAR T infusion
    - B. CAR T-cells with steroid bridge
    - C. Platinum-based salvage therapy, then autoHCT if ≥PR, CAR T-cells if <PR
    - D. Radiation therapy to active disease sites

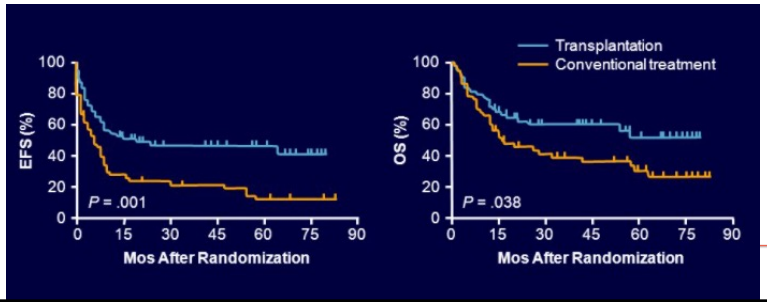
27

Case 2

- SCHOLAR-1
  - Largest pooled analysis to evaluate responses and OS rates in pts with r/r DLBCL

Endpoint	N=636
ORR to next line of tx	26%
CR to next line of tx	7%
2-y OS	20%





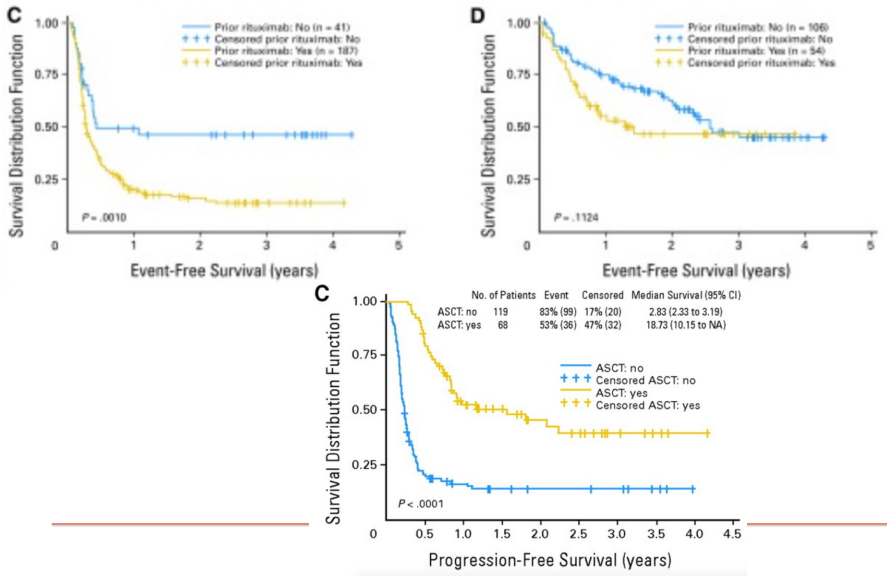
Pre-rituximab era

Crump et al, Blood 2017; Philip et al, NEJM 1995

28

Case 2

CORAL = salvage regiments with autoHCT in R/R DLBCL in rituximab era



Worse survival for prior rituximab and relapse <1 y

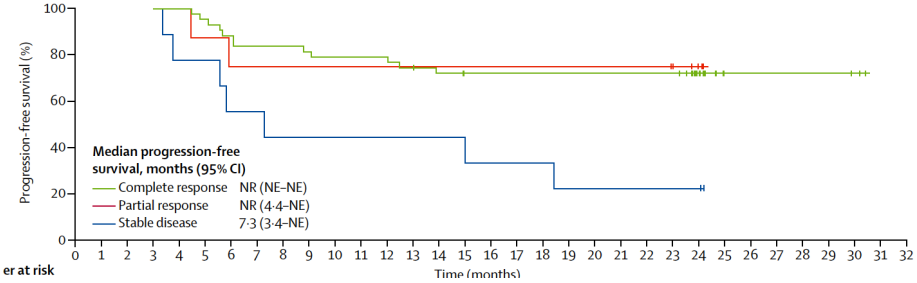
Gisselbrecht et al, J Clin Oncol 2010

29

Case 2

- Anti-19 CAR T-cell efficacy in r/r DLBCL
  - Axi-Cel (Yescarta)
  - ZUMA-1 LTFU (median f/u 27 mos)
  - Most pts received >2 lines of tx (97%)

Variable	N=101
ORR	83%
CR	58%
mDOS	11.1 mos
mPFS	5.9 mos
mOS	NR



Locke et al, Lancet Oncol 2018

30

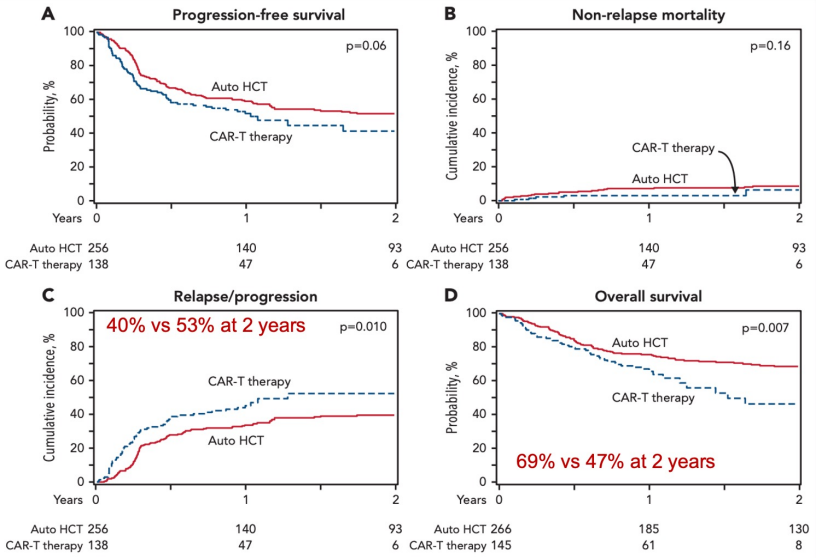
Case 2

- Retrospective CIMBTR study – autoHCT vs CAR T
- N= 411 patients in PR post-salvage
  - AutoHCT (n=266)
  - Axi-Cel (n=145)
  - Primary refractory
    - 160 pts (60%) in autoHCT arm (6 pts/2% missing info)
    - 79 pts (55%) in CAR T arm (22 pts/15% missing info)
    - Time from diagnosis to autoHCT/CAR T
      - ≤12 months:
        - » 103 pts (39%) in autoHCT arm
        - » 64 pts (44%) in CAR T arm
      - >12 months
        - » 162 pts (61%) in autoHCT arm
        - » 81 pts (56%) in CAR T arm
  - # of prior lines
    - Median (range): 2 (1-6) for autoHCT vs 3 (2-11) in CAR T
    - ≥2 lines in 89 pts (33%) in autoHCT arm vs 97 (67%) in CAR T
  - Largest node >5 cm at time of therapy
    - 76 pts (29%) in autoHCT group and 60 pts (41%) in CAR T group (*P*=0.05)

Shadman, Blood 2021

31

Case 2



Other notable points:

- Propensity score-matched analysis to match disease burden, median # of prior lines of therapy (≥2 lines) = no difference in OS/PFS
- Supports the role of autoHCT in pts with relapsed DLBCL that achieve PR post-salvage, but more data needed for pts with fewer lines of salvage therapy

32

Case 2

- Moving CAR T to earlier line of therapy
  - 3 RCTs were conducted to evaluate the efficacy of CAR T-cells earlier in the treatment course of R/R DLBCL
  - Study population for all trials includes:
    - Primary refractory
    - Early relapse (within 12 months of induction)
  - Randomized to receive CAR T-cells or SOC (salvage chemotherapy followed by autoHCT)

33

Case 2

Study design

	BELINDA	TRANSFORM	ZUMA-7
CAR T product	Tisa-cel	Liso-cel	Axi-cel
N	322	184	359
Bridging	SOC chemo	SOC chemo	Steroids only
Crossover allowed?	Yes	Yes	No (off-protocol)
Primary endpoint	EFS	EFS	EFS
Lymphodepleting regimen	Flu/Cy or Bendamustine	Flu/Cy	Flu/Cy
Time to blinded central review	Day 150	9-12 weeks	12 weeks

Bishop, N Eng J Med; Kamdar, Lancet Oncol 2022; Locke, N Eng J Med 2021

34

Case 2

Efficacy results

	BELINDA	TRANSFORM	ZUMA-7
Received definitive therapy: CAR T vs autoHCT	96% vs 33%	98% vs 47%	94% vs 36%
Received bridging in CAR T arm	83%	63%	36%
Median time from apheresis to CAR T infusion	52 days	36 days	27 days
ORR (%): CAR T vs autoHCT	75% vs 68%	86% vs 48%	83% vs 50%
CRR (%): CAR T vs autoHCT	46% vs 44%	66% vs 39%	65% vs 32%

35

Case 2

36

Case 2

Safety

	BELINDA	TRANSFORM	ZUMA-7
CRS, all grades (%)	59	49	92
CRS, grade ≥3 (%)	5	1	6
ICANS, all grades (%)	10	12	60
ICANS, grade ≥3	2	4	21

37

Case 2

- Key limitations to the studies
  - Not designed to address DLBCL pts already achieving a PR in response to salvage therapies
    - Pts are often referred to transplant/CAR T centers after starting salvage
    - CAR T has efficacy post-autoHCT relapse, the reverse is not well described
    - CAR T-capable centers are more limited than autoHCT-capable centers

38

Case 2

- The pt received 2 cycles of R-ICE
- Repeat PET/CT shows Deauville 4 (PR) at the left axilla, all other sites of disease show FDG uptake below the liver

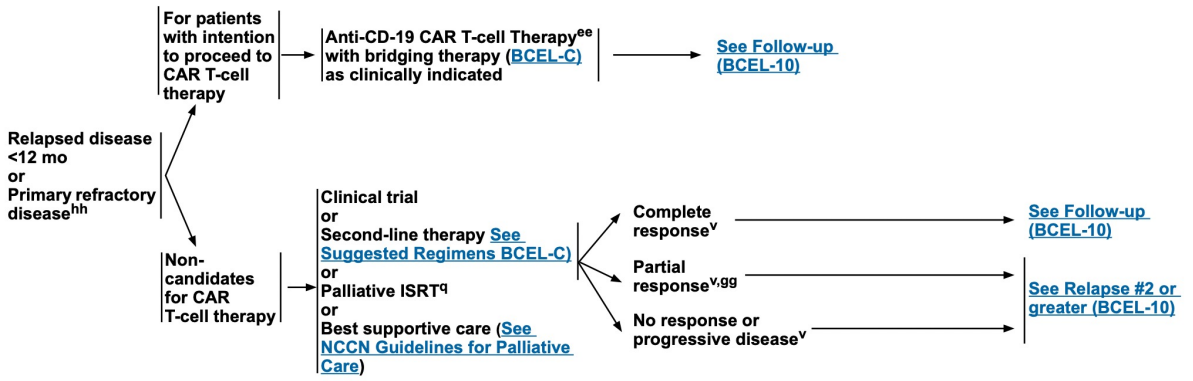
39

Case 2

- Question for the audience
  - Patient presents to discuss PET/CT results. On exam, he appears well, ECOG 0. Which of the following would be the next best step of management?
    - A. CAR T infusion
    - B. AutoHCT
    - C. Radiation therapy to the left axilla followed by surveillance
    - D. One more cycle of R-ICE then PET re-assessment

40

Case 2



NCCN guidelines

41

Case 2

- The patient undergoes Axi-Cel infusion
- 3-month PET/CT demonstrates CR
- Remains in CR at 1-year post-CAR T infusion

42

Case 2

- In the 3 RCT trials studying CAR T-cells in the 2nd line management of primary refractory or early relapse DLBCL, Axi-Cel and Liso-Cel improve EFS compared to SOC
- Differences in trial design prohibits the ability to distinguish superiority of one CAR T product over the other
- For patients unable to demonstrate chemosensitive disease, Axi-cel or Liso-cel should be considered earlier in the treatment course
- Consolidative strategy (autoHCT vs CAR T) in primary refractory or early relapse DLBCL is unclear in those achieving PR after salvage
- Getting patients to autoHCT after documented relapsed or refractory disease is difficult, and thus, CAR T-cells may provide select patients a chance at definitive treatment and long-term survival
- Role of CAR T as 2nd line treatment for DLBCL relapse >12 months is not known

43

Case 3

- HPI abridged
  - 54 yo M with a PMH of HTN presents to the ED after sudden onset back pain while chopping wood
  - No sx of hyperviscosity: vision changes/impairment, hearing loss, dizziness/vertigo, somnolence, coma, seizures, respiratory compromise, bleeding.
  - ECOG 0
- Physical exam remarkable only for midline tenderness to palpation at T11
- Labs
  - CMP: Cr 4.30, Ca++ 12.2, total protein 12.2, albumin 2.4
  - CBC: Hgb 7.9, MCV 100.2, other counts WNL and differential unremarkable
  - Misc chem: K:L 5.31, serum viscosity 1.89, LDH 330, B2MG 6.5
  - SPEP: M-spike 7.5 g/dL, IFE with 2 IgG kappa bands
  - UPEP: M-spike 4.1 mg/dL
  - IgA 36, IgM <25, IgG 7566

44

Case 3

Bone survey: Extensive lytic lesions involving the axial and appendicular skeleton, compression fracture at T11

BMBx: Hypercellular with sheets of kappa-restricted plasma cells (90% by CD138 IHC)

Cytogenetics and FISH unremarkable

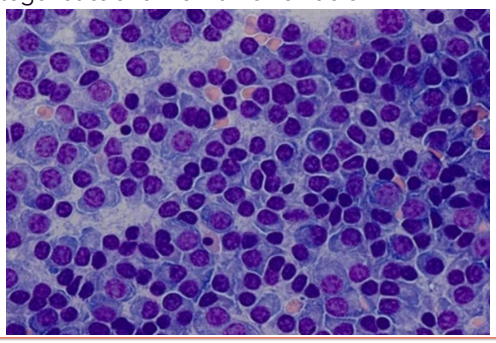


Image credit: doi:10.7759/cureus.5969

45

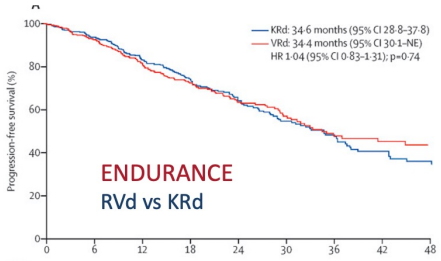
Case 3

- Question to the audience:
  - What induction regimen would you treat him with?
    - A. RVd (lenalidomide, bortezomib, dexamethasone)
    - B. VCd (bortezomib, cyclophosphamide, dexamethasone)
    - C. Rd (lenalidomide, dexamethasone)
    - D. KRd (carfilzomib, lenalidomide, dexamethasone)

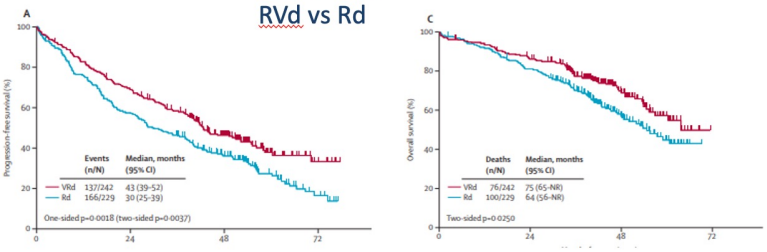
46

Case 3

- Triplet therapy is SOC for fit pts
- Induction regimen of choice?



SWOG 0777
RVd vs Rd



RVd is still the induction regimen of choice for HCT-eligible patients, but in patients with acute renal injury, VCd is preferred for at least 1 cycle

Kumar et al, Clin lymphoma myeloma leuk 2019; Kumar et al, Lancet Oncol 2020; Voorhees et al, Blood 2020

47

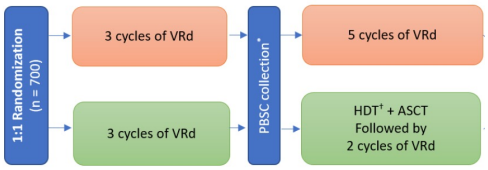
Case 3

- The patient receives 1 dose of pamidronate and IVFs
- Evaluated by apheresis and renal, who thought plasmapheresis and HD were not indicated, respectively
- The patient receives CyBorD
- Cr normalizes by C1D7
- He is switched to RVd for C2-C7 with monthly denosumab and achieves VGPR (no BMBx repeated to determine if in CR)
- Receives melphalan 140 mg/m2 and undergoes autoHCT

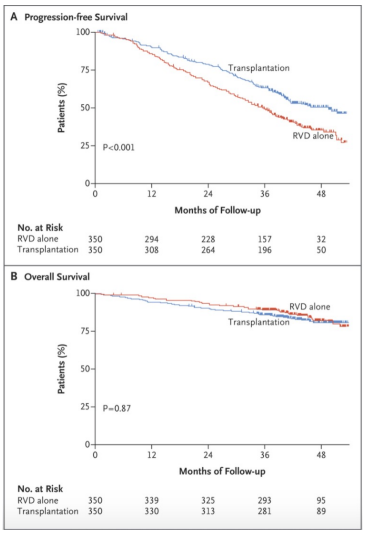
48

Case 3

- AutoHCT as a standard of care after triplet induction
  - Long-term follow-up of IFM 2009



- Relevance of PFS as an endpoint
  - Post-hoc analysis of 2 phase 3 trials showed of 1,243 pts with PD, 43.7% had morbid PD
  - Prevention of morbid events
    - Fractures
    - Renal injury and HD requirement
    - Cord compression
    - Hypercalcemia



Attal, NEJM 2017; Rosenberg, CLML 2020

49

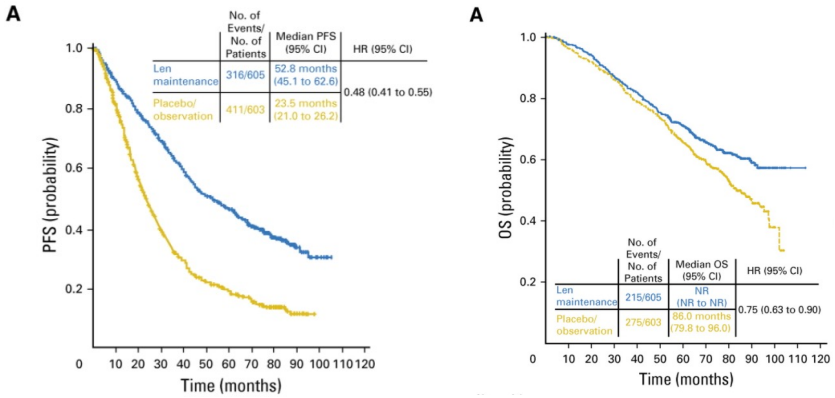
Case 3

- Question for the audience
  - What should he receive as post-autoHCT maintenance?
    - A. Bortezomib until disease progression
    - B. Lenalidomide until disease progression
    - C. Maintenance is not indicated

50

Case 3

Lenalidomide as maintenance therapy



PFS and OS benefit is seen with maintenance lenalidomide, despite the ↑increased risk of SPM

McCarthy et al, J Clin Oncol 2017

51

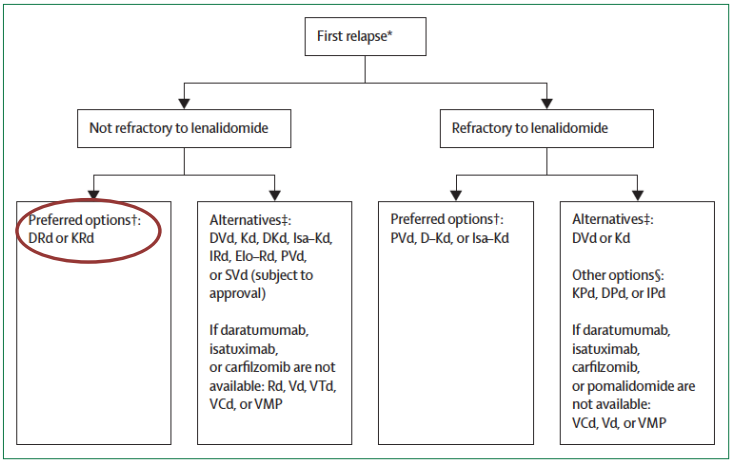
Case 3

- The patient is placed on lenalidomide maintenance and continues it until…
- SPEP shows biochemical progression 4 years post-autoHCT (serum M-protein ↑ by 1.3 g/dL above baseline)

52

Case 3

- Managing first relapse of myeloma



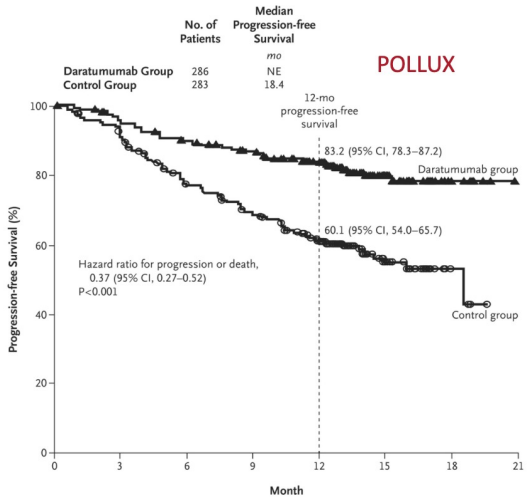
- Lenalidomide-refractory MM is defined as
  - PD during therapy
  - No response (< PR) to prior lenalidomide-containing therapy, or within 60 days of discontinuation from lenalidomide-containing regimens
  - Does not include low-dose maintenance lenalidomide

Shah, Blood 2015; Moreau, Lancet Oncol 2021

53

Case 3

He undergoes re-induction with daratumumab, lenalidomide, dexamethasone

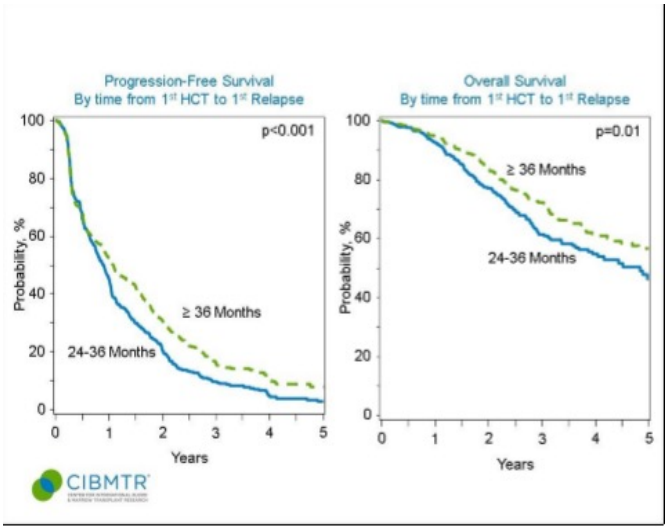


Dimopoulos, NEJM 2016

54

Case 3

He achieves VGPR once again and undergoes 2nd autoHCT with high-dose melphalan conditioning



Dhakal, Leukemia 2021

55

Case 3

- Pt outcome
  - Remains in remission 2 years out from autoHCT

56

Case 3

- Summary
  - In the absence of an AKI, RVd is the standard frontline treatment for multiple myeloma
  - AutoHCT for MM is still preferred in fit pts directly after induction, although depending on pt preferences, may be delayed until after first relapse
  - Lenalidomide maintenance should be considered for at least 2 years post-autoHCT if pt can tolerate
  - Many options exist for managing r/r MM, and choice should be tailored to prior treatment history and pt-related factors
  - A second autoHCT, especially if PFS ≥3 years after first autoHCT, is an acceptable treatment approach upon disease control with salvage regimens
